

Scattering amplitudes

(not only for cosmologists)

Jaroslav Trnka

*Center for Quantum Mathematics and Physics,
University of California, Davis
& IPNP, Charles University in Prague*

Plan

- ❖ Motivation to study scattering amplitudes (history)
- ❖ New methods: amplitudes and geometry
- ❖ Amplitudes in EFTs (potentially relevant for cosmology)

Hidden simplicity in scattering amplitudes

Holy grail of theoretical physics

What are the Fundamental Laws of Nature?

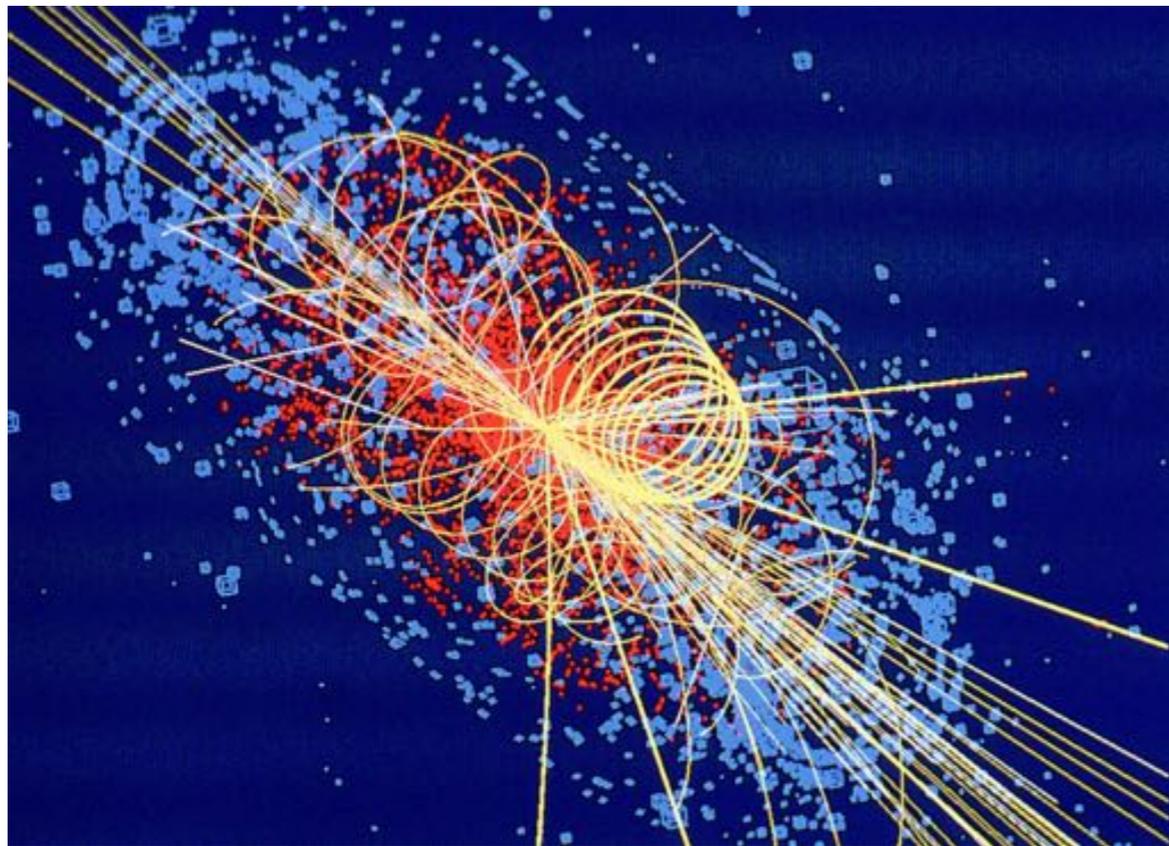

What are the
elementary
physical forces?

Why is the
Universe big?

What is the theory
of everything?

Probing fundamental laws

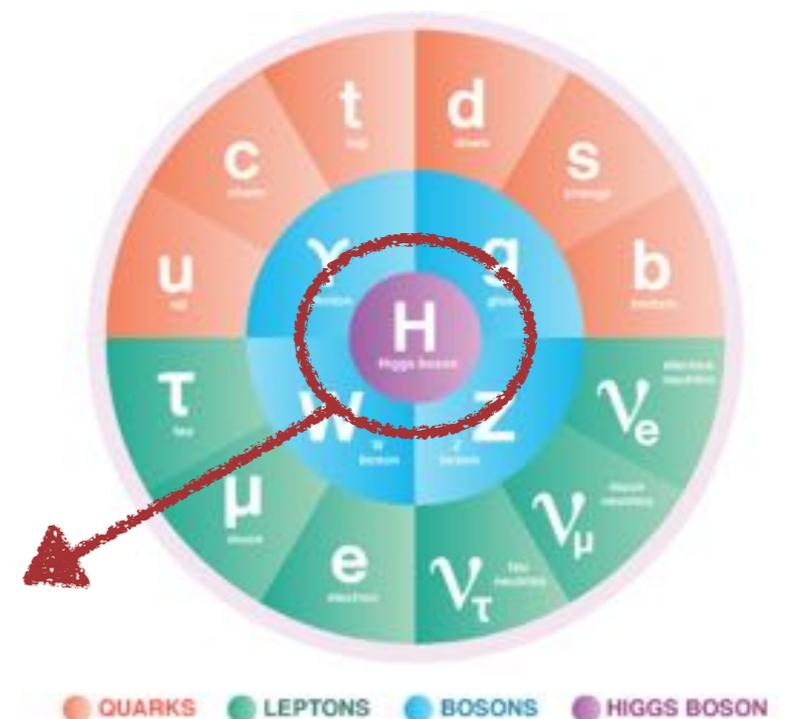

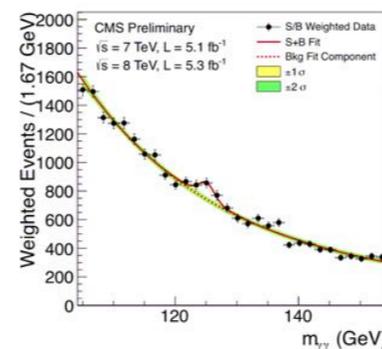

What is the menu
of elementary particles?

How do they interact?

Standard model of elementary particles

Higgs discovery
2012

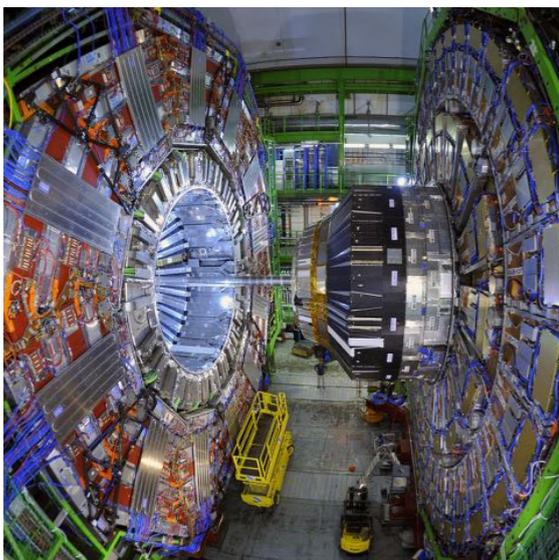

Search for new physics

Beyond Standard model

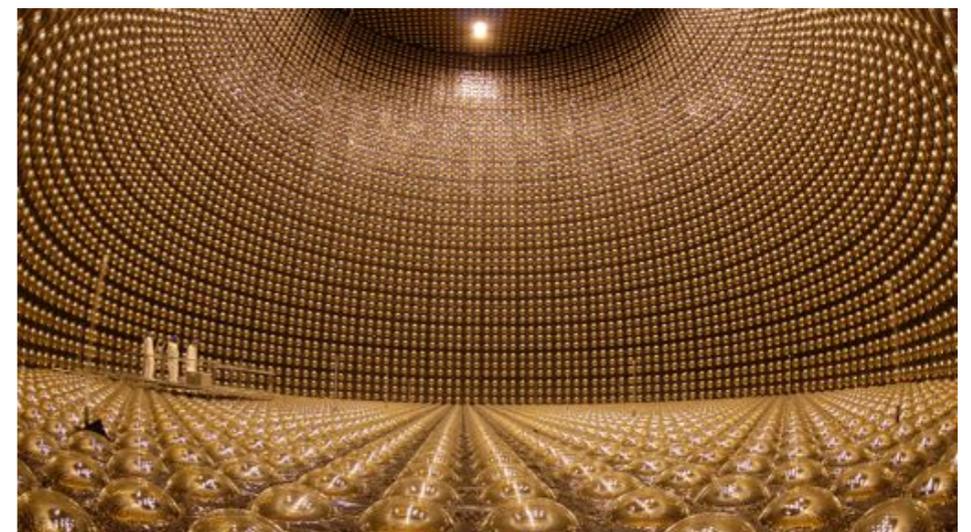

Higgs potential, proton decay,
WIMPs, search for SUSY,
neutrino mass, anomalies,...

LHC, Fermilab, future colliders

neutrino experiments

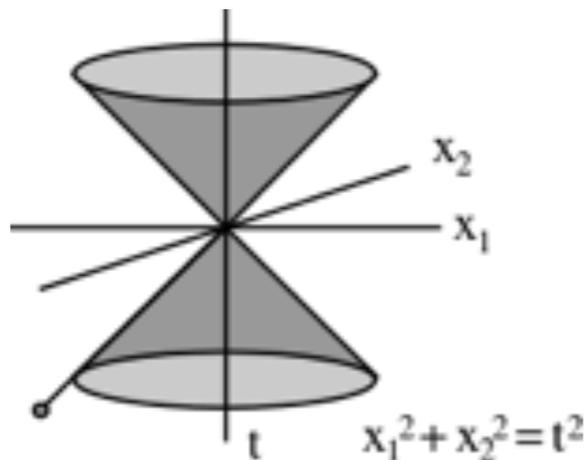

Theorist's perspective

- ❖ Theoretical framework to describe physical systems
- ❖ Compatible with two principles

Special relativity

Quantum mechanics

$$H(t)|\psi(t)\rangle = i\hbar \frac{\partial}{\partial t} |\psi(t)\rangle$$

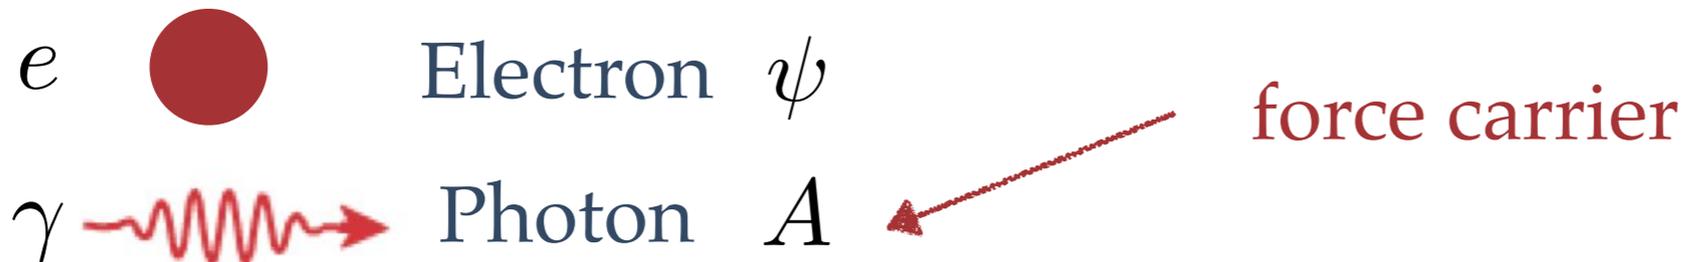

Quantum Field Theory (QFT)

Quantum Field Theory

Dirac, Feynman, Dyson, Schwinger (1926-1950s)

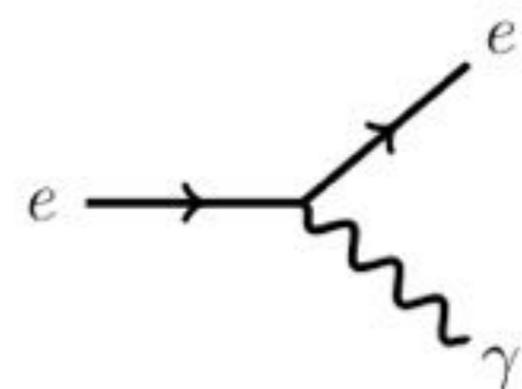

- ❖ Elementary particles described by fields, their interactions (physical forces) by Lagrangian.
- ❖ Example: Quantum Electrodynamics - QFT for EM

We associate a picture

$$\mathcal{L} = q \cdot \psi \psi A$$

 Lagrangian  strength of interaction

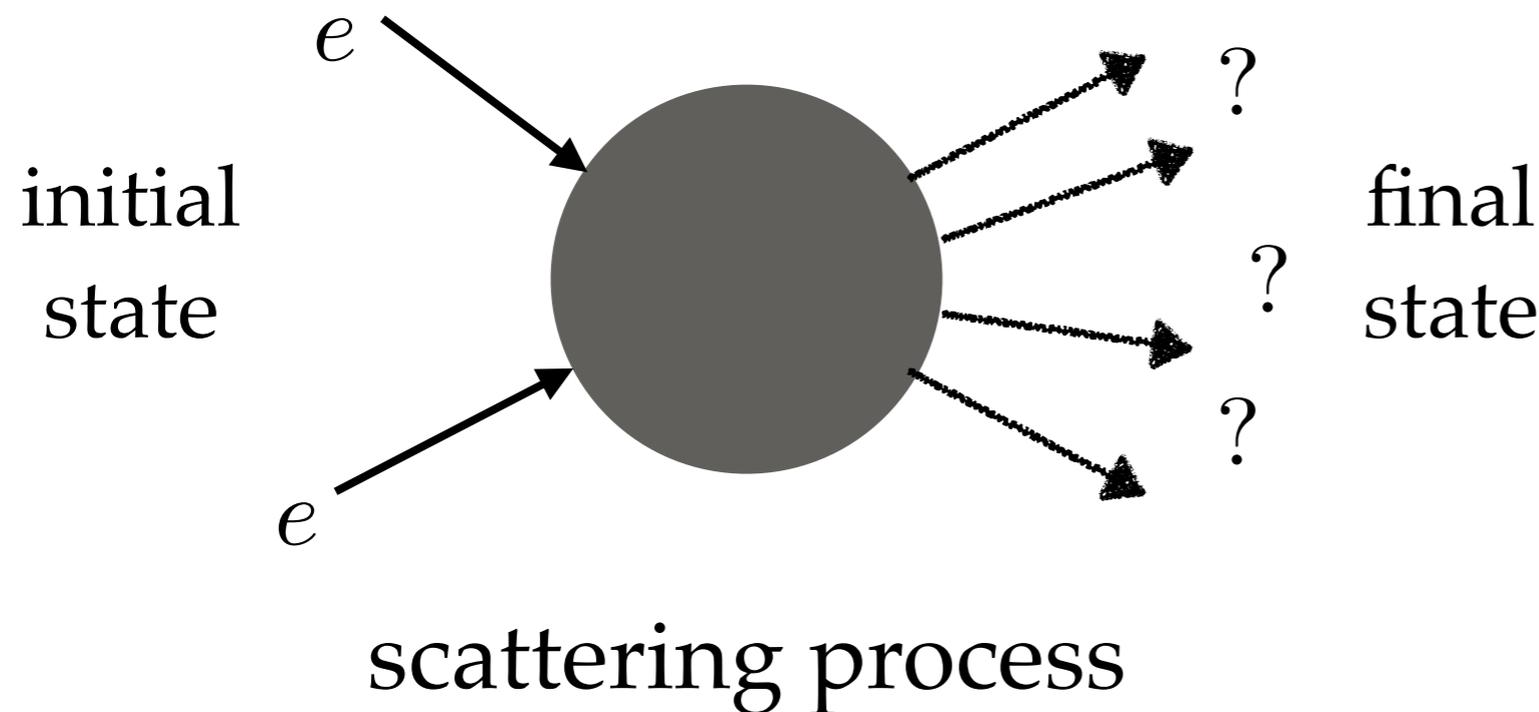

Quantum Field Theory

Dirac, Feynman, Dyson, Schwinger (1926-1950s)

- ❖ Use QFT to predict outcomes of particle experiments

Quantum mechanics:
all final states possible

Probabilities given by

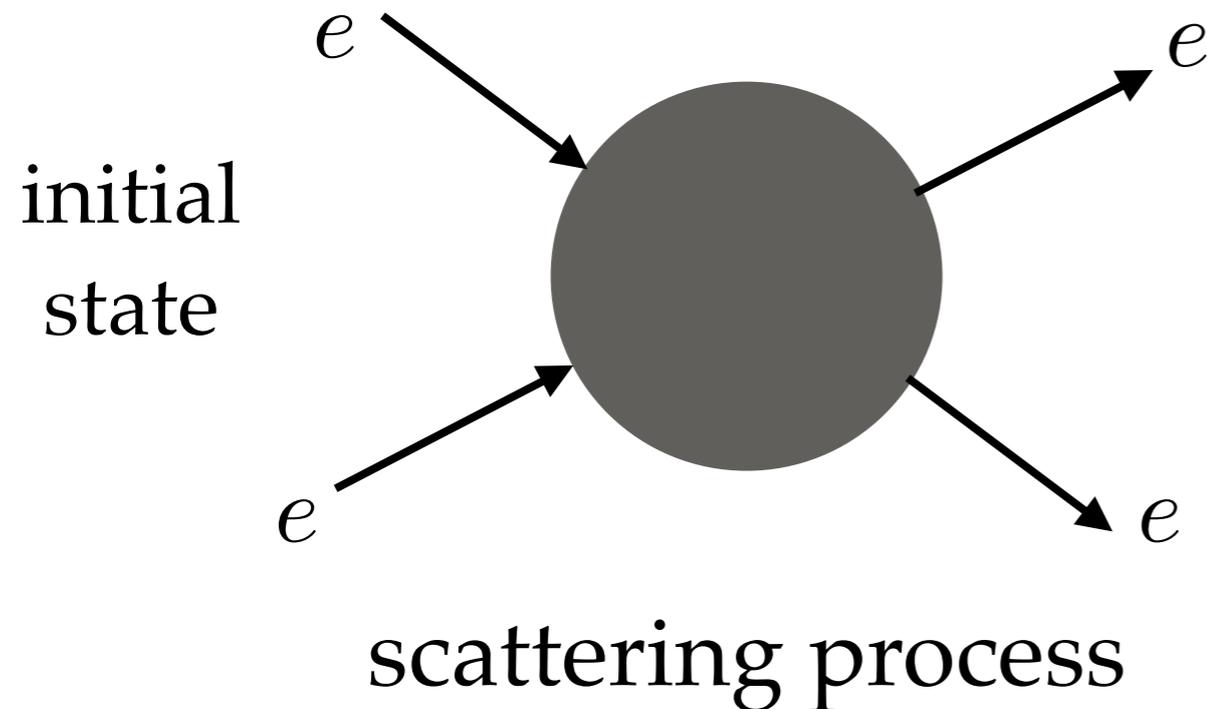

Scattering amplitudes
 $A(in, out)$

Quantum Field Theory

Dirac, Feynman, Dyson, Schwinger (1926-1950s)

- ❖ Use QFT to predict outcomes of particle experiments

$$A(ee \rightarrow ee)$$

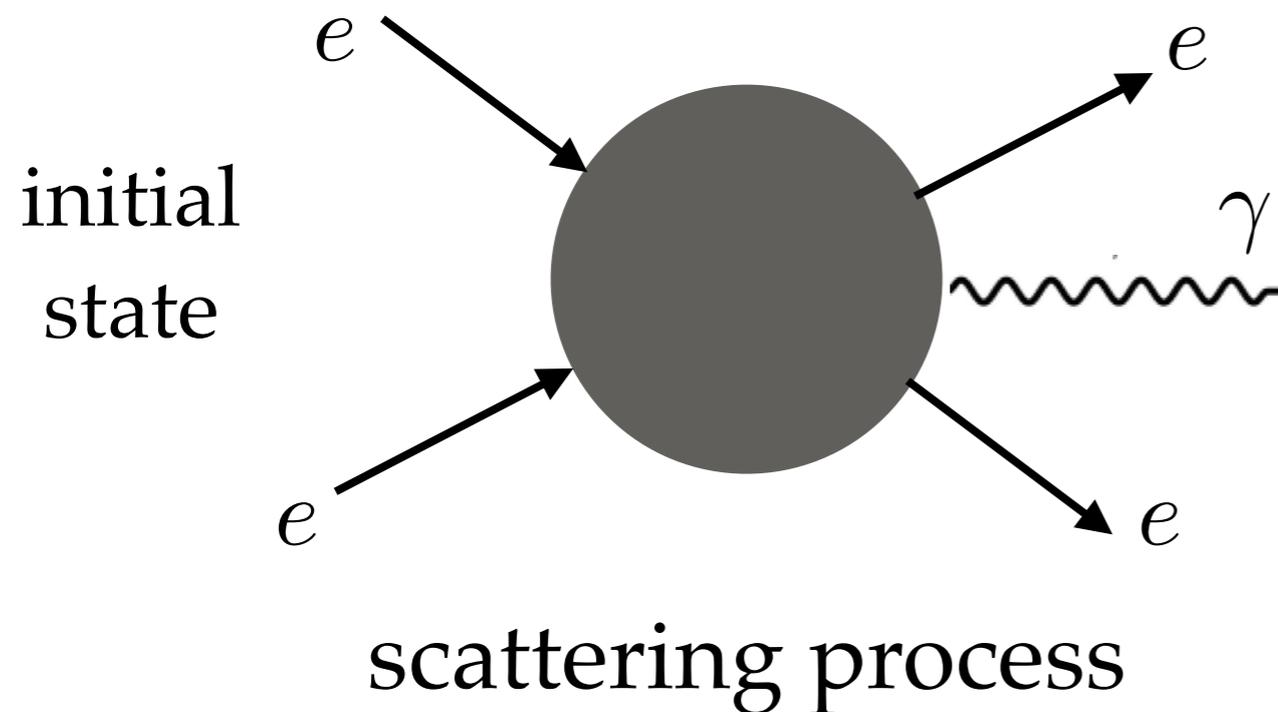

Function of energies
and angles of particles

Quantum Field Theory

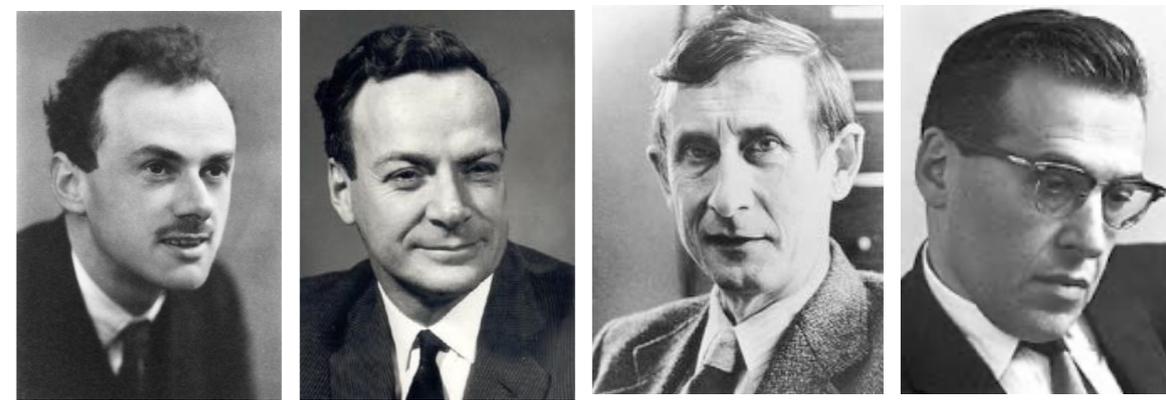

Dirac, Feynman, Dyson, Schwinger (1926-1950s)

- ❖ Use QFT to predict outcomes of particle experiments

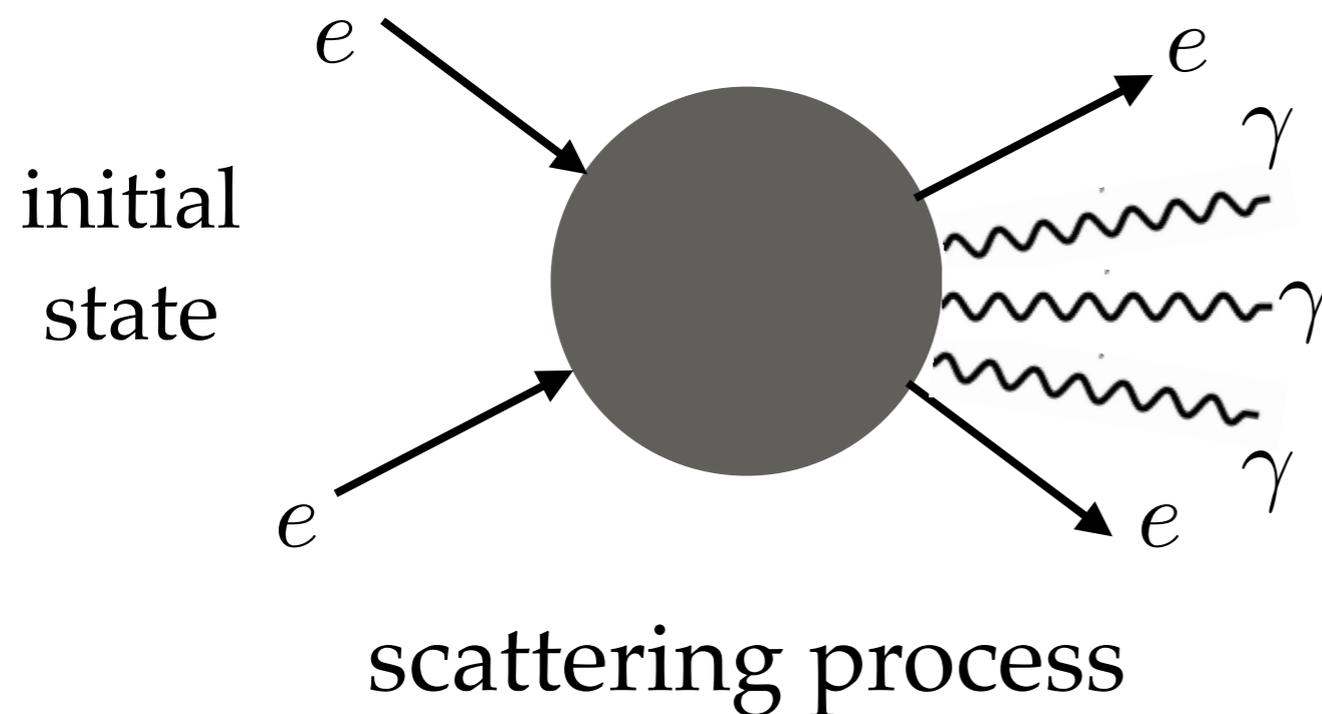

$A(ee \rightarrow ee\gamma)$
Function of energies
and angles of particles

Quantum Field Theory

Dirac, Feynman, Dyson, Schwinger (1926-1950s)

- ❖ Use QFT to predict outcomes of particle experiments

$$A(ee \rightarrow ee\gamma\gamma\gamma)$$

Function of energies
and angles of particles

probability: square of amplitude

$$p_i \sim |A|^2$$

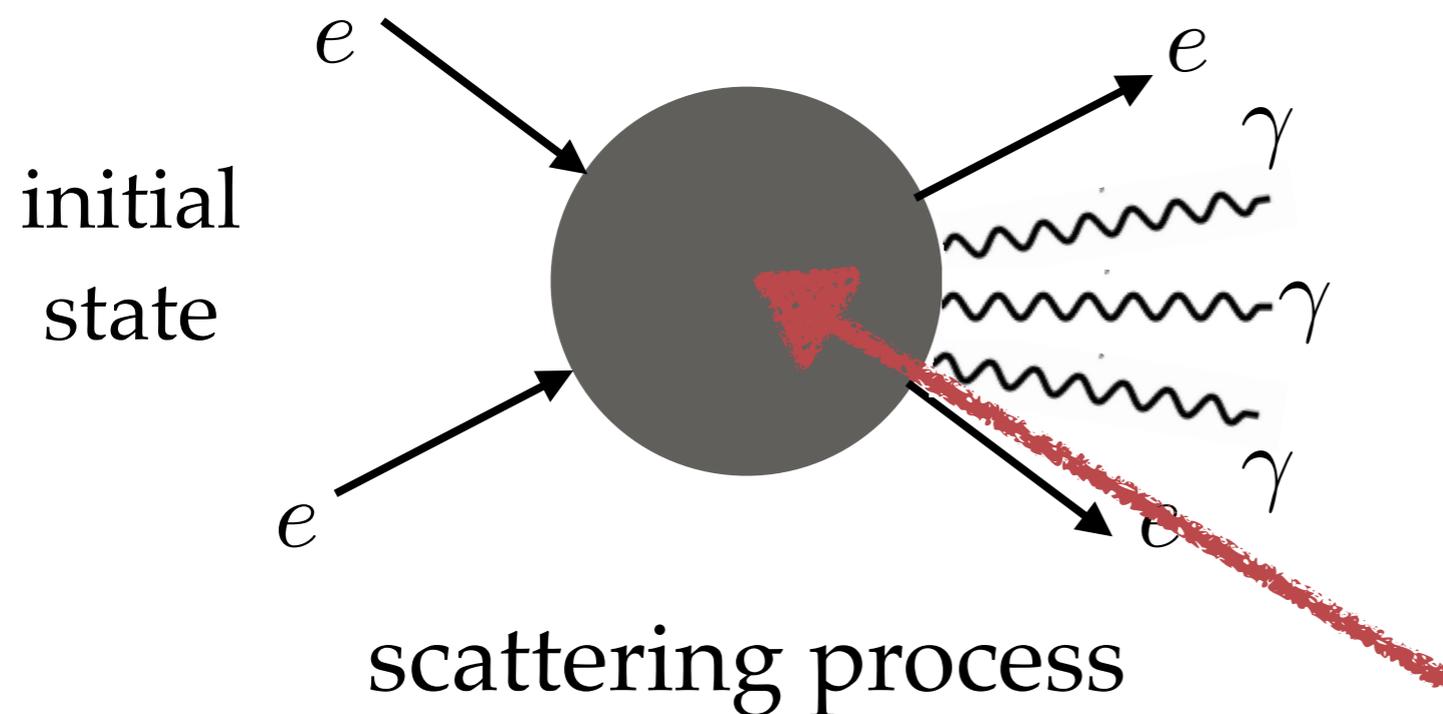

Unitarity: some of probabilities $\sum_i p_i = 1$

Quantum Field Theory

Dirac, Feynman, Dyson, Schwinger (1926-1950s)

- ❖ Use QFT to predict outcomes of particle experiments

$A(ee \rightarrow ee\gamma\gamma\gamma)$
Function of energies
and angles of particles

Big question:
What happens inside?

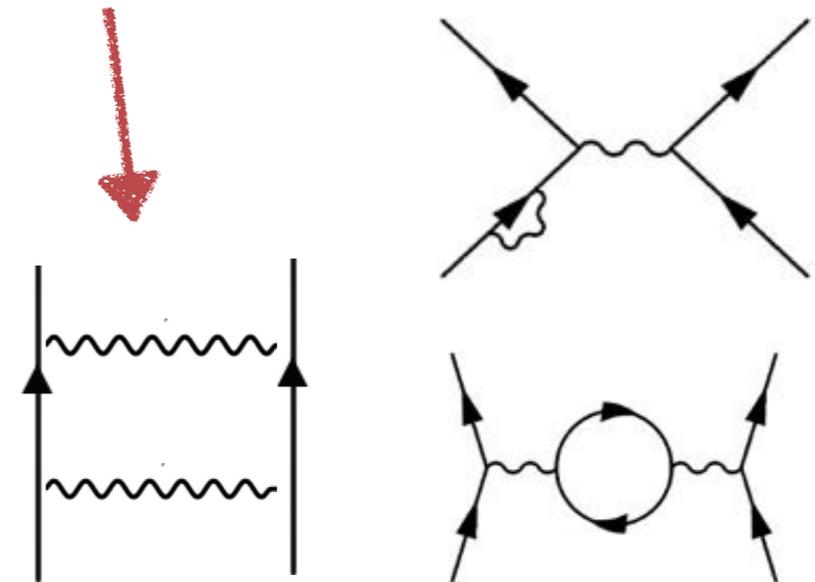

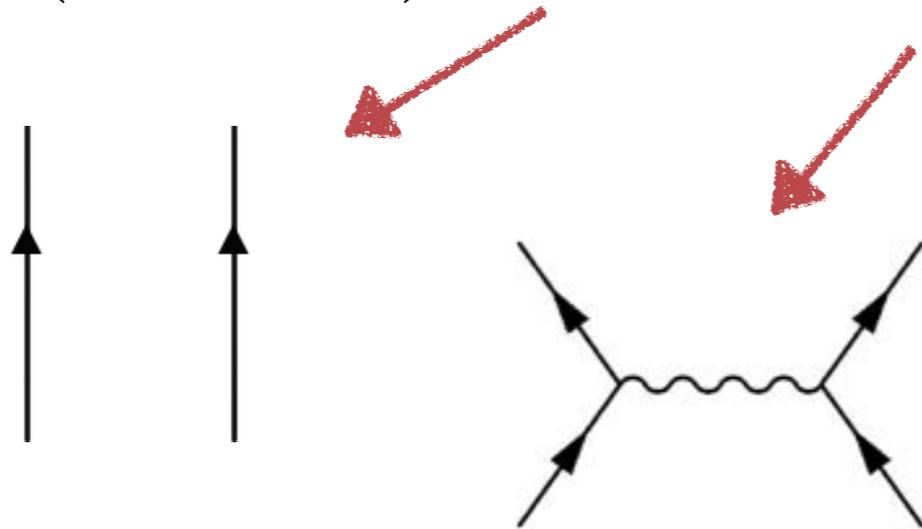

Perturbative QFT

Feynman, Dyson, Schwinger (1940s-1950s)

- Expansion of the amplitude for small q : weak coupling

$$A(ee \rightarrow ee) = 1 + q^2 \cdot A_0 + q^4 \cdot A_1 + q^6 \cdot A_2 + \dots$$

and
many
others

Feynman diagrams

(Expansion of the path integral)

$$Z = \int \mathcal{D}\psi \mathcal{D}\bar{\psi} \mathcal{D}A e^{iS}$$

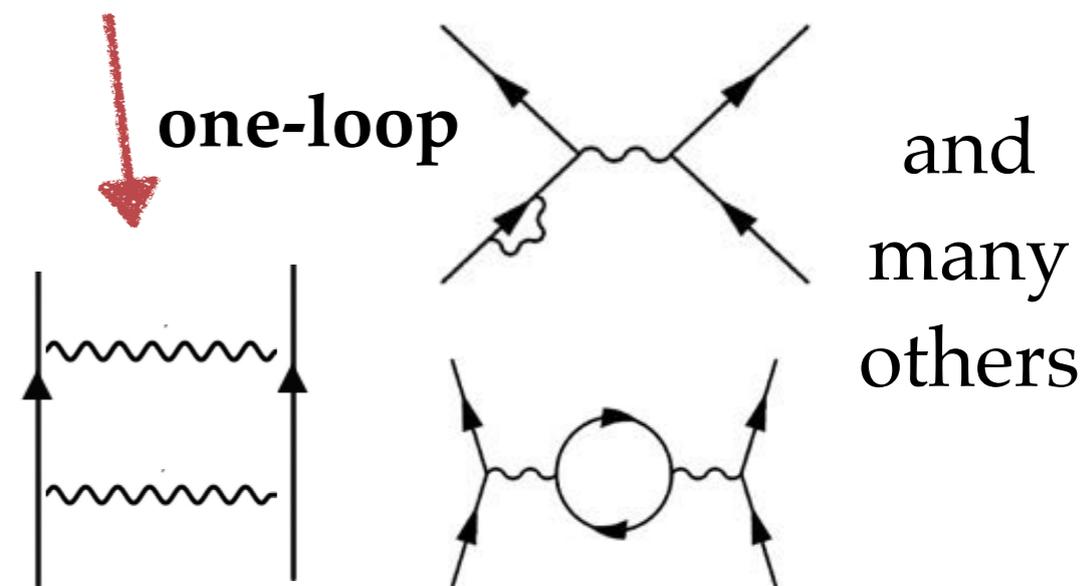

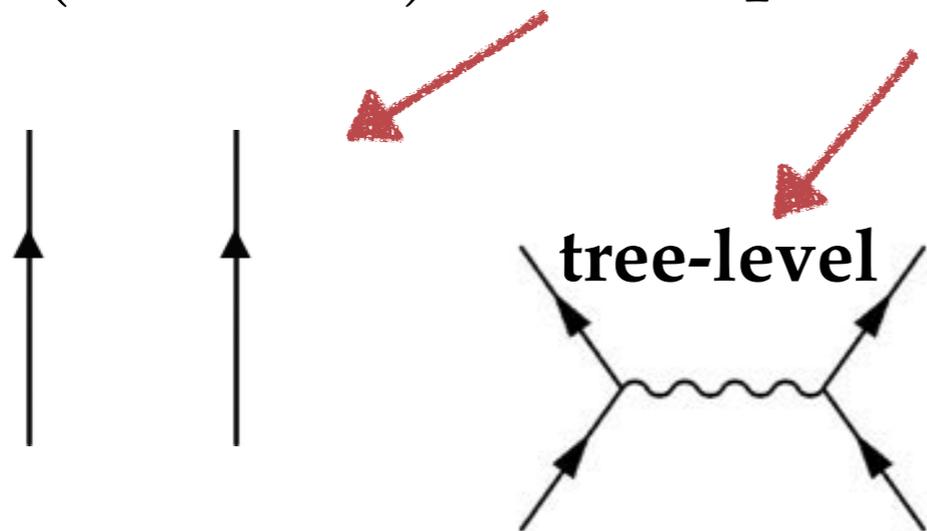

Perturbative QFT

Feynman, Dyson, Schwinger (1940s-1950s)

- Expansion of the amplitude for small q : weak coupling

$$A(ee \rightarrow ee) = 1 + q^2 \cdot A_0 + q^4 \cdot A_1 + q^6 \cdot A_2 + \dots$$

Feynman diagrams

Loop expansion

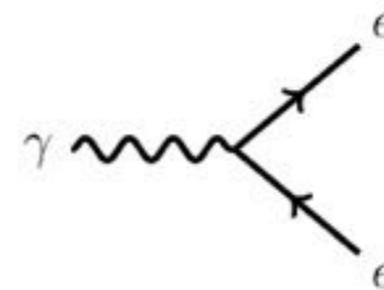

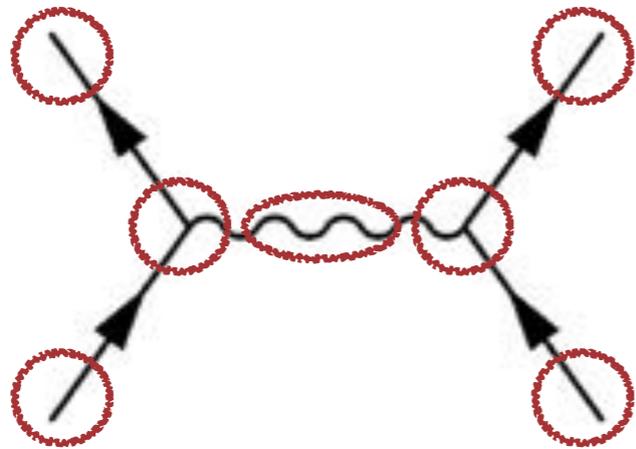

$$\left(\begin{array}{l} \text{Expansion of the path integral} \\ Z = \int \mathcal{D}\psi \mathcal{D}\bar{\psi} \mathcal{D}A e^{iS} \end{array} \right)$$

Quantum Field Theory

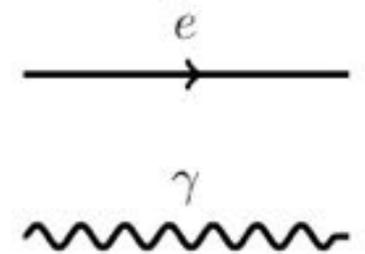

Feynman, Dyson, Schwinger (1940s-1950s)

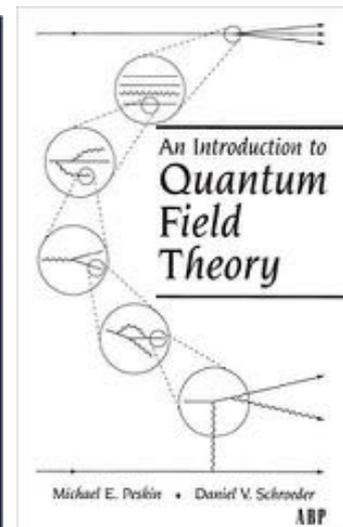

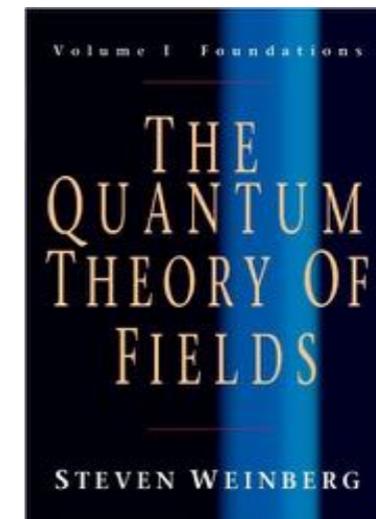

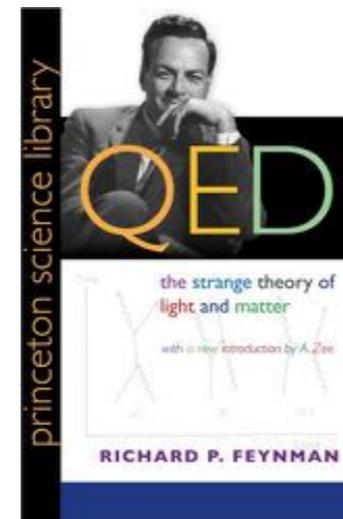

- ❖ Simple diagrammatics: draw all Feynman diagrams
- ❖ Each diagram: contribution to amplitude

gluing these pictures

Feynman rules: prescription how to convert diagram into formula

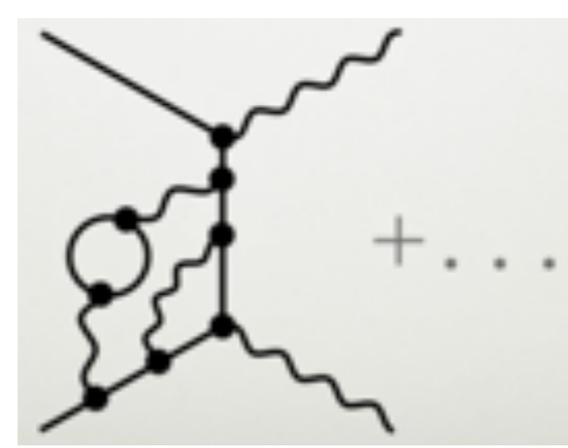

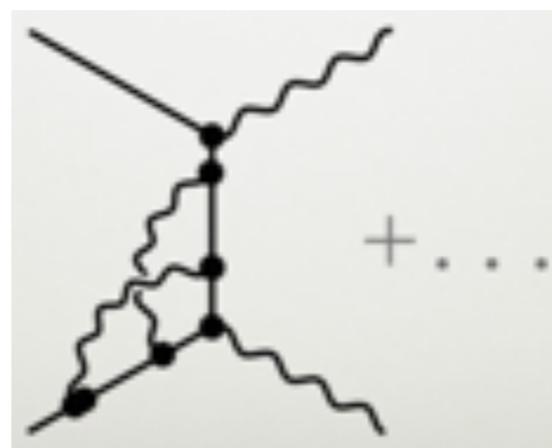

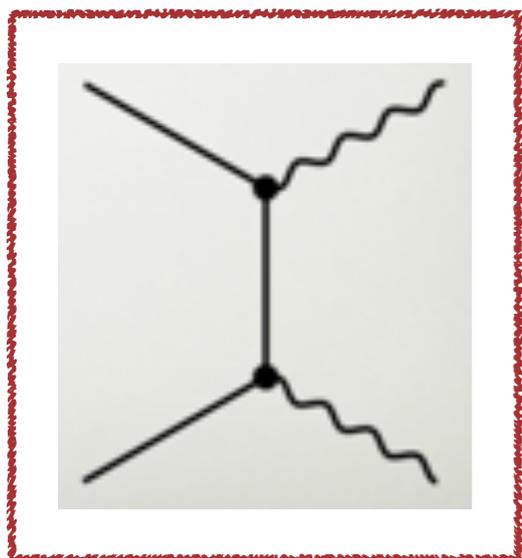

Great success of QFT

- ❖ QFT has passed countless tests in last 70 years
- ❖ Example: Magnetic dipole moment of electron

1928

Theory: $g_e = 2$

Experiment: $g_e \sim 2$

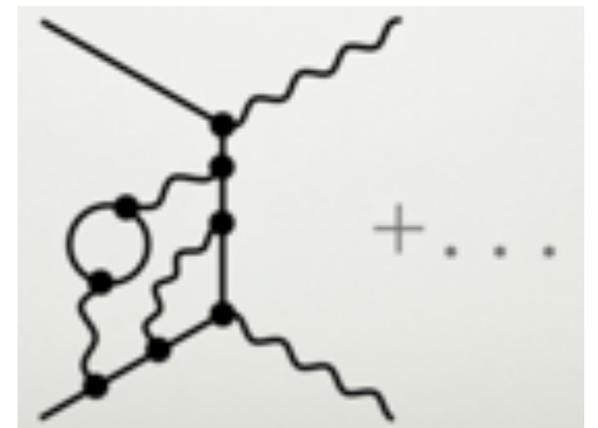

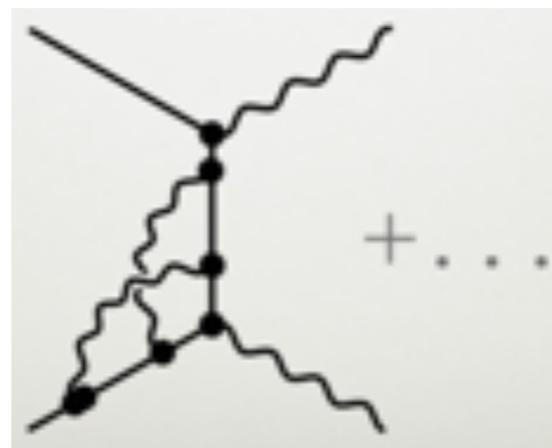

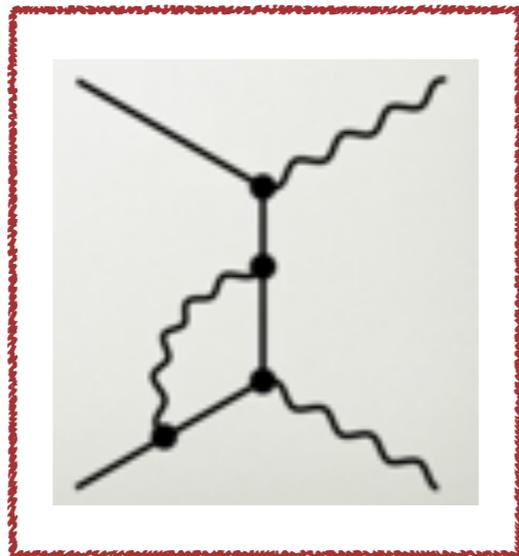

Great success of QFT

- ❖ QFT has passed countless tests in last 70 years
- ❖ Example: Magnetic dipole moment of electron

1947

Theory: $g_e = 2.00232$

Experiment: $g_e = 2.0023$

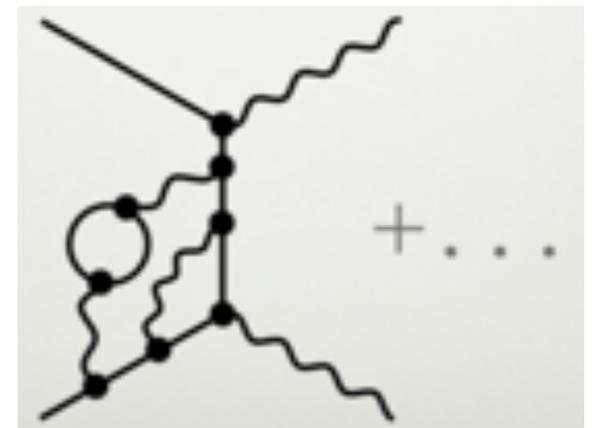

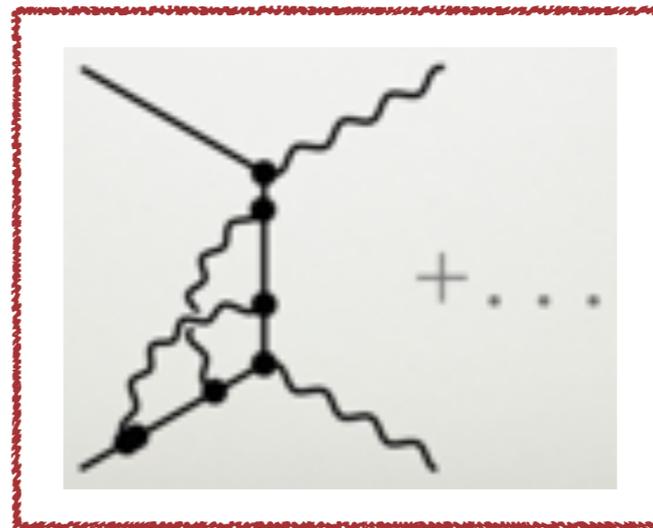

Great success of QFT

- ❖ QFT has passed countless tests in last 70 years
- ❖ Example: Magnetic dipole moment of electron

1957 Theory: $g_e = 2.0023193$

1972 Experiment: $g_e = 2.00231931$

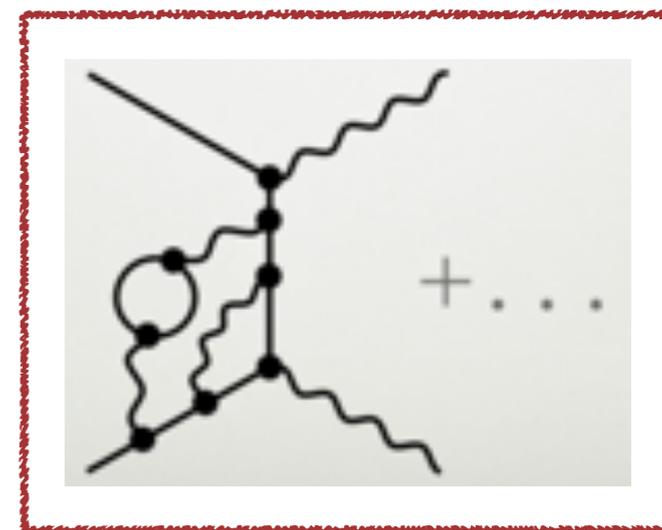

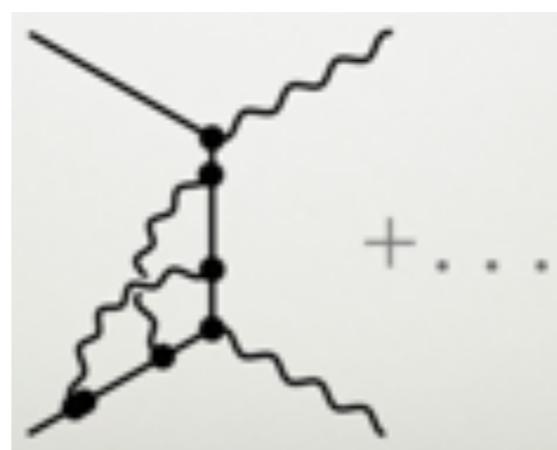

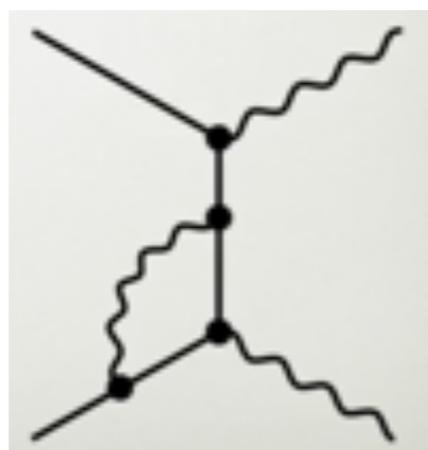

Great success of QFT

- ❖ QFT has passed countless tests in last 70 years
- ❖ Example: Magnetic dipole moment of electron

1990

Theory: $g_e = 2.0023193044$

Experiment: $g_e = 2.00231930438$

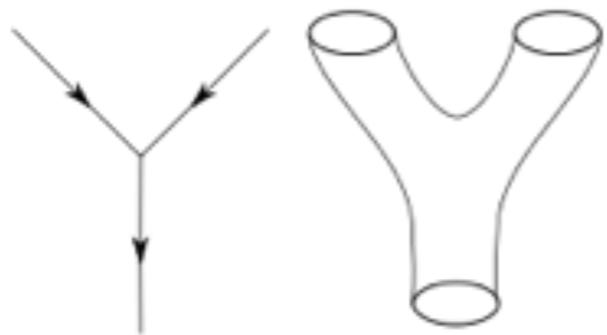

Problems with gravity

More conceptual problem: tension between QFT and gravity

QFT: local observables - interactions happen at a point,
gravity forbids them - what is quantum gravity?

Our best attempt: **string theory**

concept: consistent unification
of QFT and gravity

AdS/CFT correspondence:
QFT is “dual” to string theory

strongly coupled,
no gravity

weakly coupled,
with gravity

Maldacena (1997)

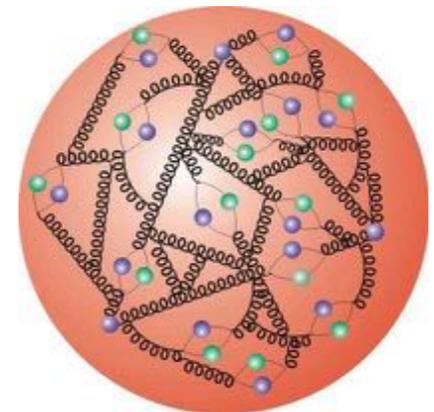

QFT picture incomplete

Despite all successes our understanding
of QFT is incomplete

If there is a new formulation of QFT, we should
see footprint in the weak coupling regime:
structure of scattering amplitudes

QCD background and new physics

- ❖ Distinguish new physics from Standard model
 - Accurate theoretical predictions of background needed
- ❖ Colliders: protons at high energies
 - Main component is scattering of gluons
- ❖ Standard procedure: Feynman diagrams

Status of the art: early 1980s

- ❖ Most complicated process: $gg \rightarrow ggg$ at leading order

Brute force calculation
24 pages of result

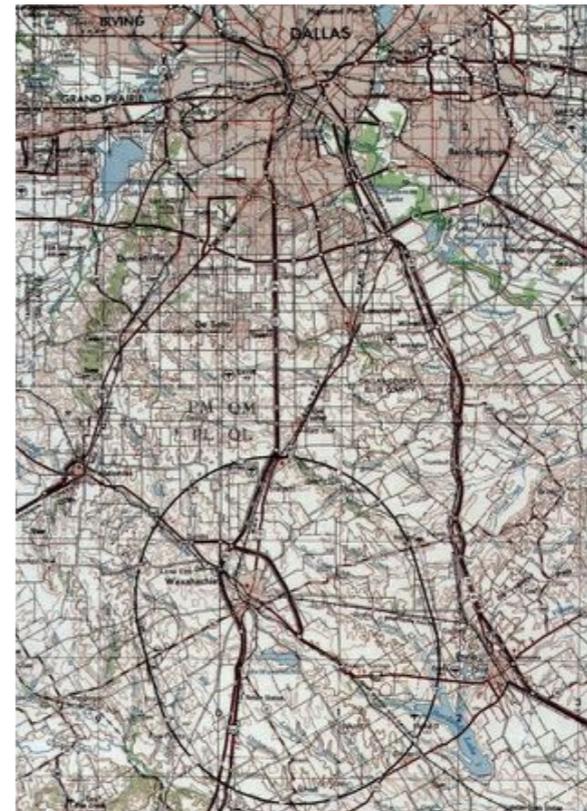

$$(k_1 \cdot k_4)(\epsilon_2 \cdot k_1)(\epsilon_1 \cdot \epsilon_3)(\epsilon_4 \cdot \epsilon_5)$$

- ❖ Perhaps not every question has a simple answer.....

New collider

- ❖ 1983: Superconducting Super Collider approved
- ❖ Energy 40 TeV: many gluons!

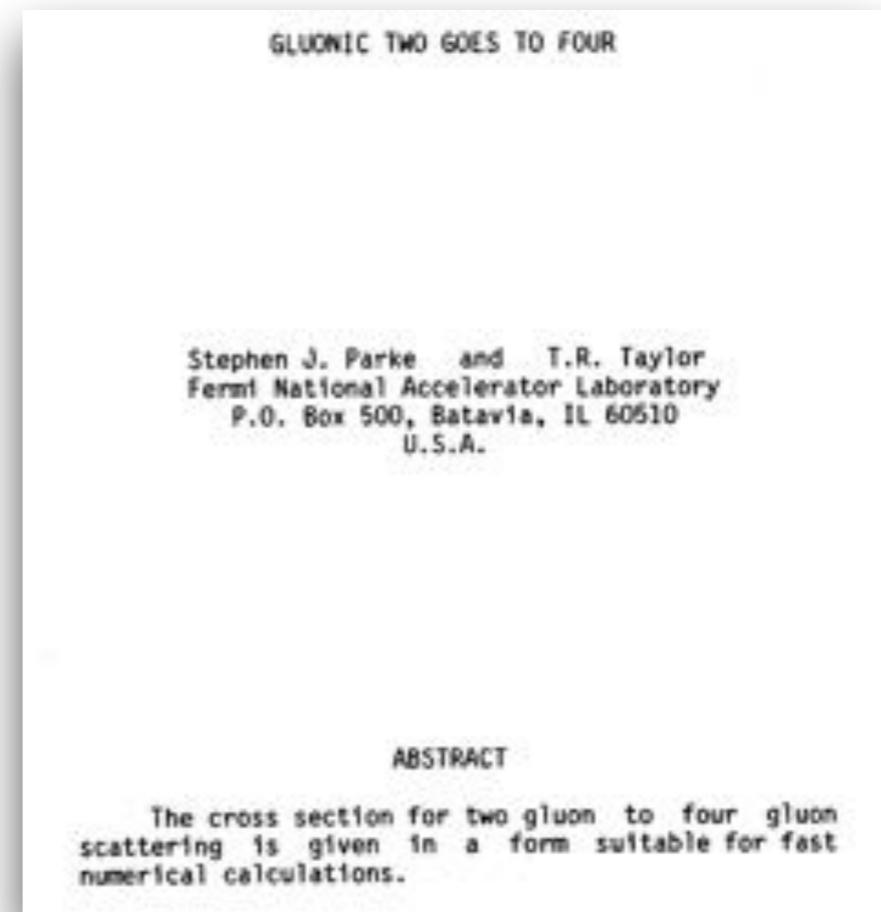

- ❖ Demand for calculations, next on the list: $gg \rightarrow gggg$

Hidden simplicity in scattering amplitudes

Parke, Taylor (1985)

- ❖ Process $gg \rightarrow gggg$
- ❖ 220 Feynman diagrams, ~ 100 pages of calculations
- ❖ Paper with 14 pages of result

Hidden simplicity in scattering amplitudes

Parke, Taylor (1985)

- ❖ Process $gg \rightarrow gggg$
- ❖ 220 Feynman diagrams, ~ 100 pages of calculations

Hidden simplicity in scattering amplitudes

Parke, Taylor (1985)

Our result has successfully passed both these numerical checks.
Details of the calculation, together with a full exposition of our techniques, will be given in a forthcoming article. Furthermore, we hope to obtain a simple analytic form for the answer, making our result not only an experimentalist's, but also a theorist's delight.

Hidden simplicity in scattering amplitudes

Parke, Taylor (1985)

Our result has successfully passed both these numerical checks.
Details of the calculation, together with a full exposition of our techniques, will be given in a forthcoming article. Furthermore, we hope to obtain a simple analytic form for the answer, making our result not only an experimentalist's, but also a theorist's delight.

- ❖ Within a year they realized

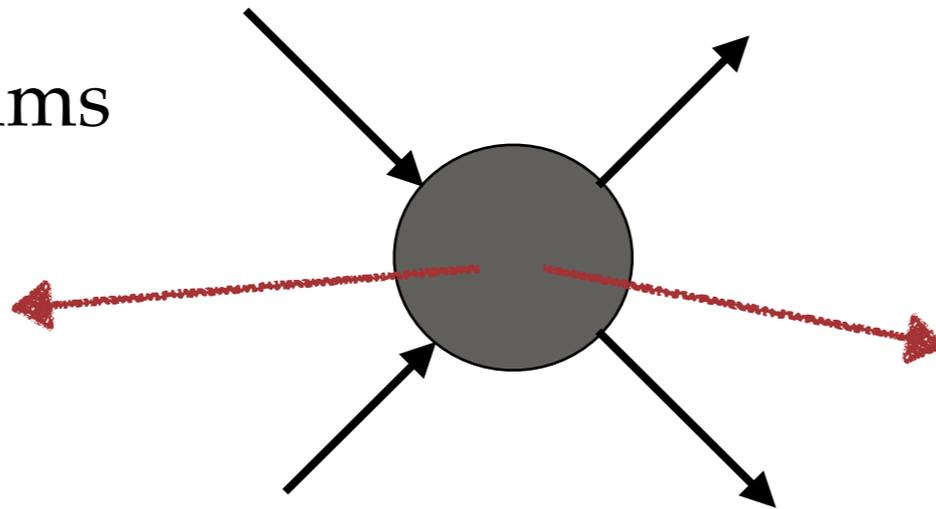

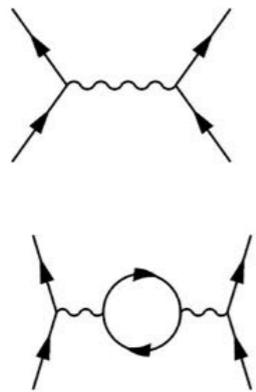

$$|A_6|^2 \sim \frac{(p_1 \cdot p_2)^3}{(p_2 \cdot p_3)(p_3 \cdot p_4)(p_4 \cdot p_5)(p_5 \cdot p_6)(p_6 \cdot p_1)}$$

- ❖ Final result is much simpler than individual diagrams!

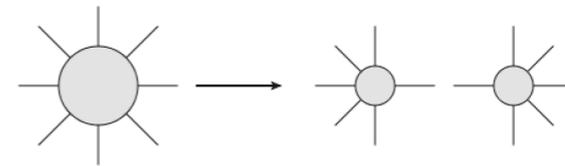

Change of strategy

What is the scattering amplitude?

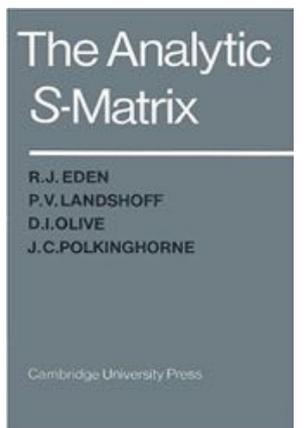

Feynman diagrams

Unique object fixed
by physical properties

Was not successful
(1960s)

Modern methods use both:

- Calculate the amplitude directly
- Use perturbation theory

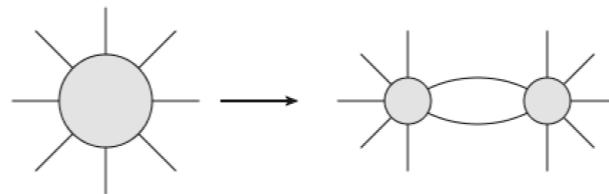

Life without Feynman diagrams

❖ New efficient methods of calculations

● Unitarity methods

Bern, Dixon, Kosower (1990s)

BlackHat collaboration
QCD background for LHC

● Recursion relations

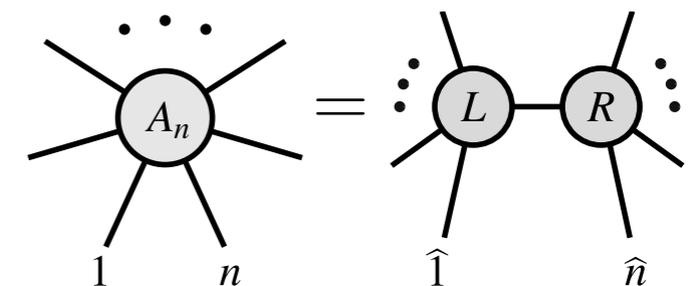

Britto, Cachazo, Feng, Witten (2005)

Cohen, Elvang, Kiermaier (2010)

Arkani-Hamed, Bourjaily, Cachazo, Caron-Huot, Trnka (2010)

Cheung, Kampf, Novotny, Shen, Trnka (2015)

Build amplitude recursively from simpler amplitudes

	$gg \rightarrow 4g$	$gg \rightarrow 5g$	$gg \rightarrow 6g$
Feynman diagrams	220	2485	34300
Terms in recursion	3	6	20

Breadth of Amplitudes field

Very broad field, many (often orthogonal) research interests

S-matrix is a tool to study many different things

- ❖ New efficient methods to calculate higher-loop amplitudes, numerics, special functions
- ❖ Use amplitudes as a tool to probe QFT (new principles, symmetries, unexpected connections, integrability)
- ❖ Applications of methods to other fields: gravitational waves, study of cosmological correlators

Amplitudes conferences

❖ Many meetings, conferences and workshops

❖ Annual Amplitudes conference

- 2009 Durham
- 2010 London
- 2011 Michigan
- 2012 Hamburg
- 2013 Munich
- 2014 Paris
- 2015 Zurich
- 2016 Stockholm
- 2017 Edinburgh

- 2019 Dublin
- 2020 Michigan
- 2021 Copenhagen
- **2022 Prague**

Amplitudes 2022
August 8–12, 2022
Prague, Czech Republic

Amplitudes 2022, the 14th in a series of annual meetings, brings together a community of researchers in this fast-growing field of theoretical physics, interested in both formal and practical aspects of scattering amplitudes, and wide range of applications from pure mathematics to collider and gravitational wave physics.

Speakers:
- Nima Arkani-Hamed (IAS Prin)
- Niklas Beisert (ETH Zurich)
- Zvi Bern (UCLA)
- Francis Brown* (CNRS-IMJ Pg)
- Freddy Cachazo* (Perimeter I)
- Lance Dixon (SLAC)
- James Drummond (LAPTH An)
- Claude Duhr (ETH Zurich)
- Gregory Korchemsky (CSA Sa)
- David Kosower* (SPH Saclay)
- Lev Lipatov* (St. Petersburg)
- Giovanni Ossola (NYC Coll. Te)
- Sovrat Raju (IIT Allahabad)
- David Skinner (Perimeter Inst)
- Vladimir A. Smirnov (SNP I)
- Marc Sprodlin (Brown Univ)
- Gabriele Travaglini (Queen)
- Pedro Vieira (Perimeter Inst)
*to be confirmed

Sponsors
This conference receives funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme (Novel structures in scattering amplitudes, grant agreement No 725110). We also acknowledge the support of Charles University, the Czech Science Foundation, the Czech Academy of Sciences and Masaryk University.

Amplitudes Summer School will take place the week prior to the conference August 1-6, 2022

Geometric picture for scattering amplitudes

with Arkani-Hamed, Bourjaily, Cachazo, Goncharov, Henn, Herrmann,
Postnikov, Thomas and many others

Amplitude as a volume

Hodges (2009)

In 2009 Hodges studied recursion relations for gluon amplitudes

He wanted to use twistor variables introduced by Penrose in 1970s in his own attempt for quantum gravity

For particular six-gluon amplitude at tree-level he took the result

$$A_6 =$$

Diagram 1: A central vertical line connects two vertices. The top vertex has two external lines labeled 2 and $\hat{3}$, both with minus signs. The bottom vertex has four external lines labeled 1, $\hat{4}$, 5, and 6, with signs -, +, +, + respectively.

Diagram 2: A central vertical line connects two vertices. The top vertex has three external lines labeled 1, 2, and $\hat{3}$, with signs -, -, - respectively. The bottom vertex has three external lines labeled $\hat{4}$, 5, and 6, with signs +, +, + respectively.

Amplitude as a volume

Hodges (2009)

In 2009 Hodges studied recursion relations for gluon amplitudes

He wanted to use twistor variables introduced by Penrose in 1970s in his own attempt for quantum gravity

For particular six-gluon amplitude at tree-level he took the result and rewrote using momentum twistor variables

$$A_6 = \frac{\langle 1345 \rangle^3}{\langle 1245 \rangle \langle 2345 \rangle \langle 1234 \rangle \langle 1235 \rangle} - \frac{\langle 1356 \rangle^3}{\langle 1256 \rangle \langle 6123 \rangle \langle 2356 \rangle \langle 1235 \rangle}$$

And the expressions look familiar to him

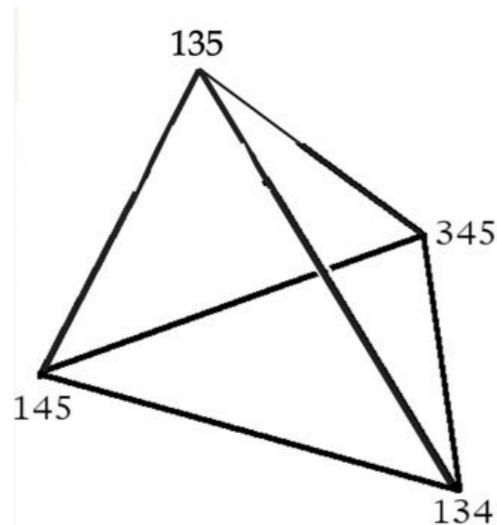

Amplitude as a volume

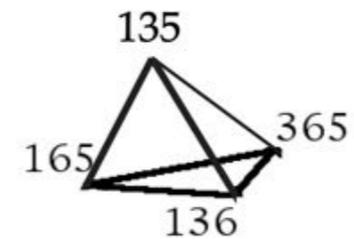

Hodges (2009)

They are **volumes** of tetrahedra in momentum twistor space!

$$\frac{\langle 1345 \rangle^3}{\langle 1245 \rangle \langle 2345 \rangle \langle 1234 \rangle \langle 1235 \rangle}$$

$$\frac{\langle 1356 \rangle^3}{\langle 1256 \rangle \langle 6123 \rangle \langle 2356 \rangle \langle 1235 \rangle}$$

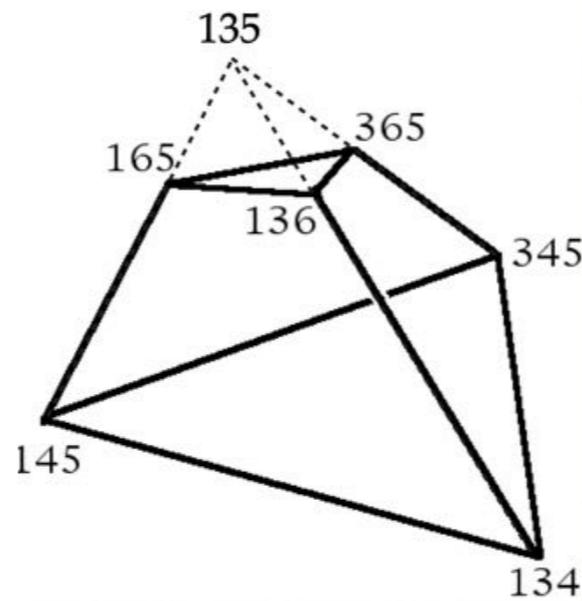

Amplitude as a volume

Hodges (2009)

They are **volumes** of tetrahedra in momentum twistor space!

$$\frac{\langle 1345 \rangle^3}{\langle 1245 \rangle \langle 2345 \rangle \langle 1234 \rangle \langle 1235 \rangle} - \frac{\langle 1356 \rangle^3}{\langle 1256 \rangle \langle 6123 \rangle \langle 2356 \rangle \langle 1235 \rangle}$$

These two pieces subtract, we are triangulating polyhedron

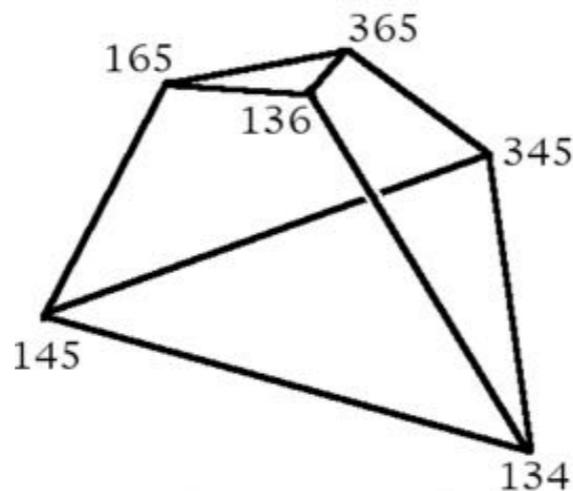

Amplitude as a volume

Hodges (2009)

They are **volumes** of tetrahedra in momentum twistor space!

$$\frac{\langle 1345 \rangle^3}{\langle 1245 \rangle \langle 2345 \rangle \langle 1234 \rangle \langle 1235 \rangle} \quad - \quad \frac{\langle 1356 \rangle^3}{\langle 1256 \rangle \langle 6123 \rangle \langle 2356 \rangle \langle 1235 \rangle}$$

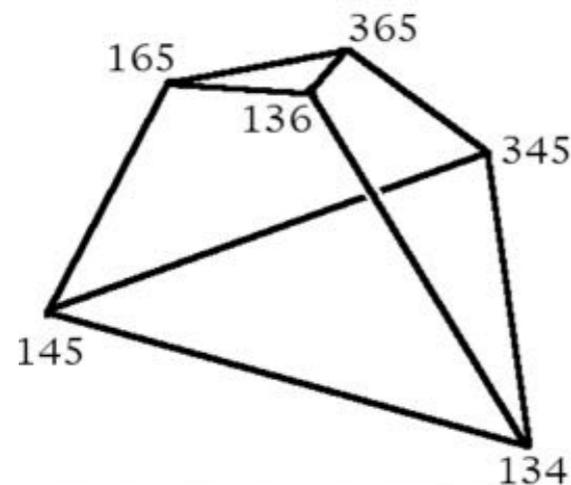

Amplitude is a volume of polyhedron!

Amplitude as a volume

Hodges (2009)

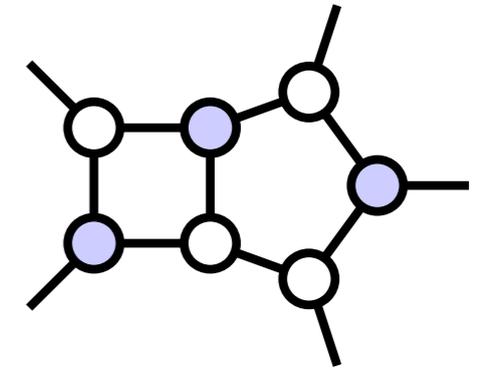

There is some triangulation in terms
220 pieces = Feynman diagrams

This was true for a simplest six-gluon amplitude, but did not seem to work for all tree-level amplitudes, neither loops.

We need “bigger space” to fit all amplitudes there.

On-shell diagrams and Positive Grassmannian

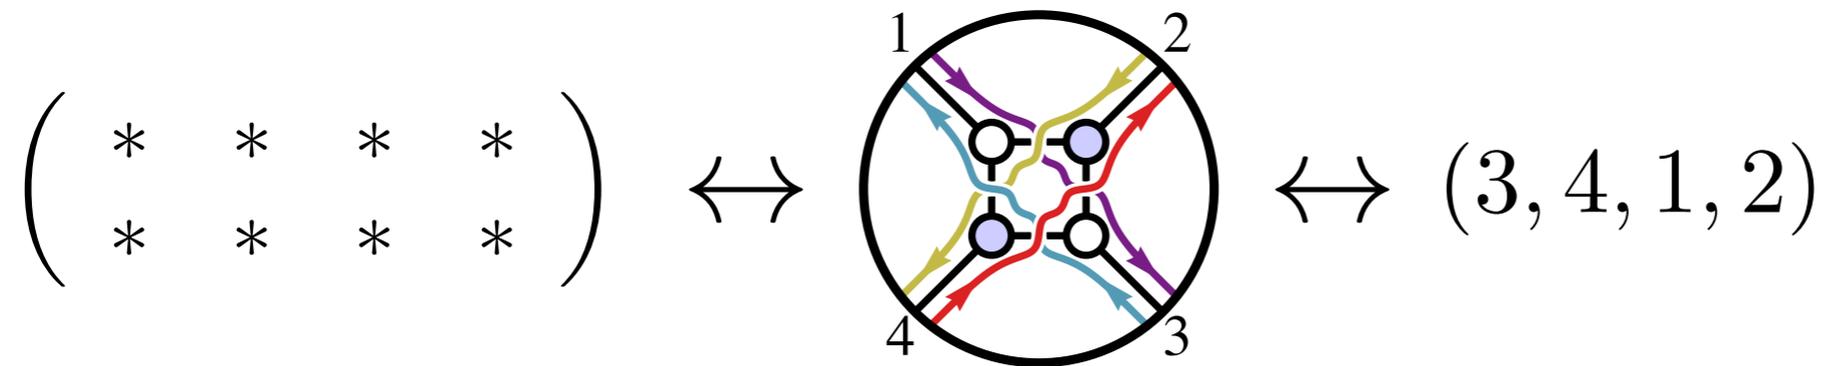

Around the same time: **plabic graphs**

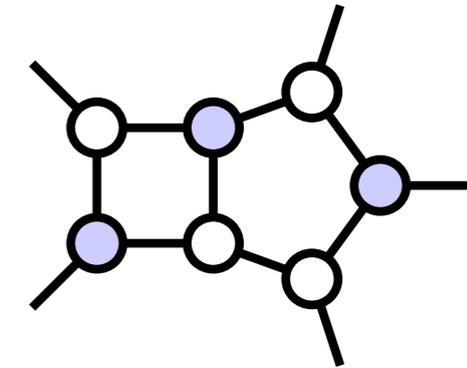

- represent permutations
- correspond to positive matrices

Postnikov, Goncharov (2005-2010)

On-shell diagrams and Positive Grassmannian

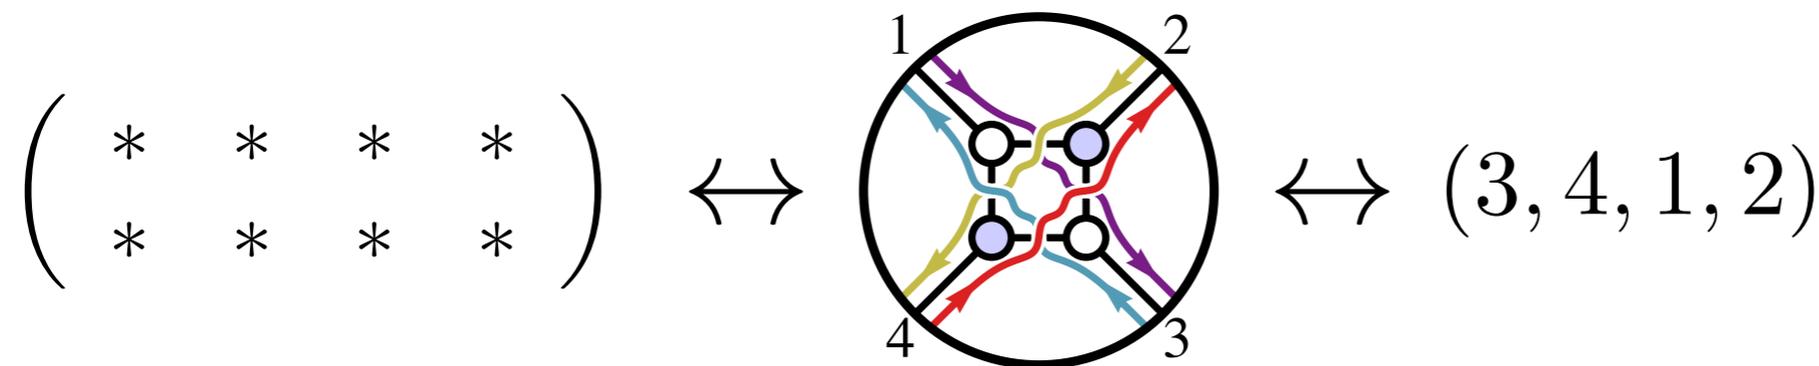

Around the same time: **plabic graphs**

- represent permutations
- correspond to positive matrices

Postnikov, Goncharov (2005-2010)

Same graphs appear in amplitudes - **on-shell diagrams**
 Terms in recursion relations, “cuts” of loop amplitudes

[arXiv:1212.5605](#) [pdf, other]

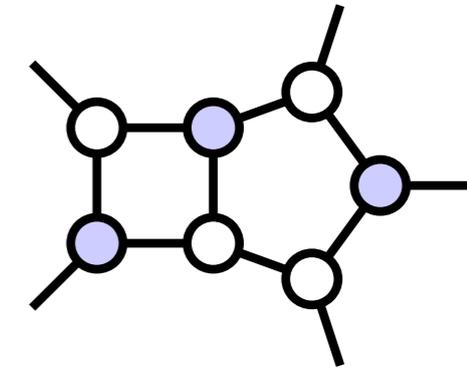

Scattering Amplitudes and the Positive Grassmannian

Nima Arkani-Hamed, Jacob L. Bourjaily, Freddy Cachazo, Alexander B. Goncharov, Alexander Postnikov, Jaroslav Trnka

Comments: a handful of minor corrections and citations added/updated; 158 pages, 264 figures

Subjects: High Energy Physics - Theory (hep-th); Algebraic Geometry (math.AG); Combinatorics (math.CO)

Record on arxiv?

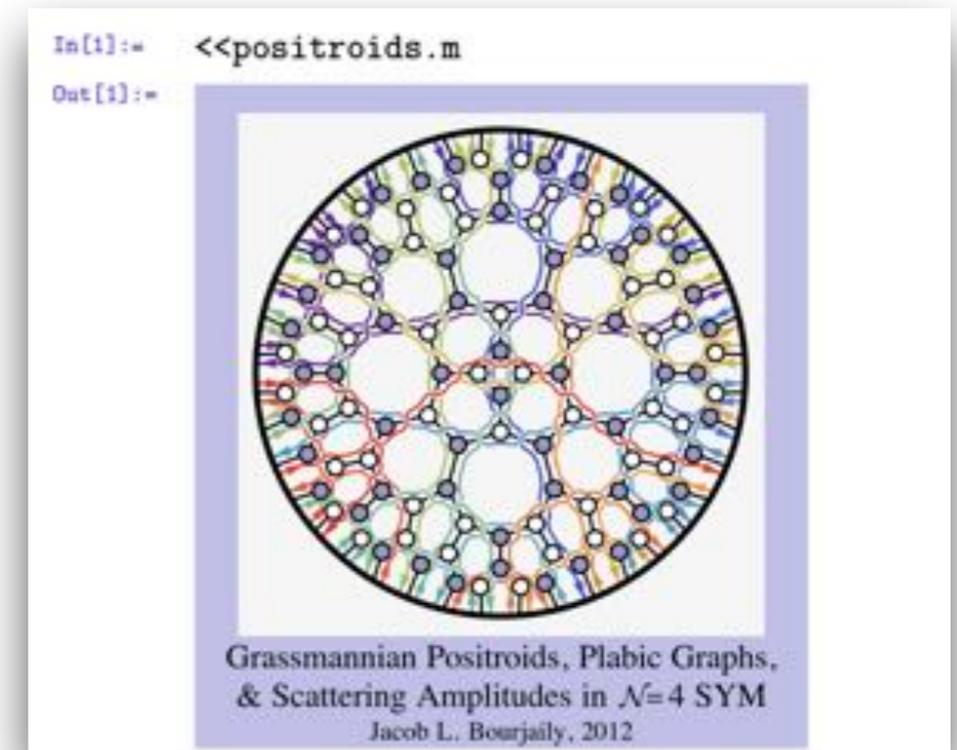

On-shell diagrams and Positive Grassmannian

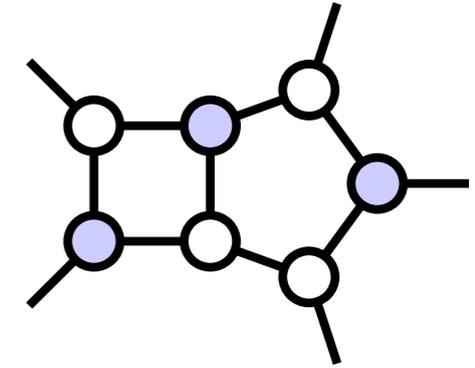

Very efficient way to calculate (tree-level) amplitudes

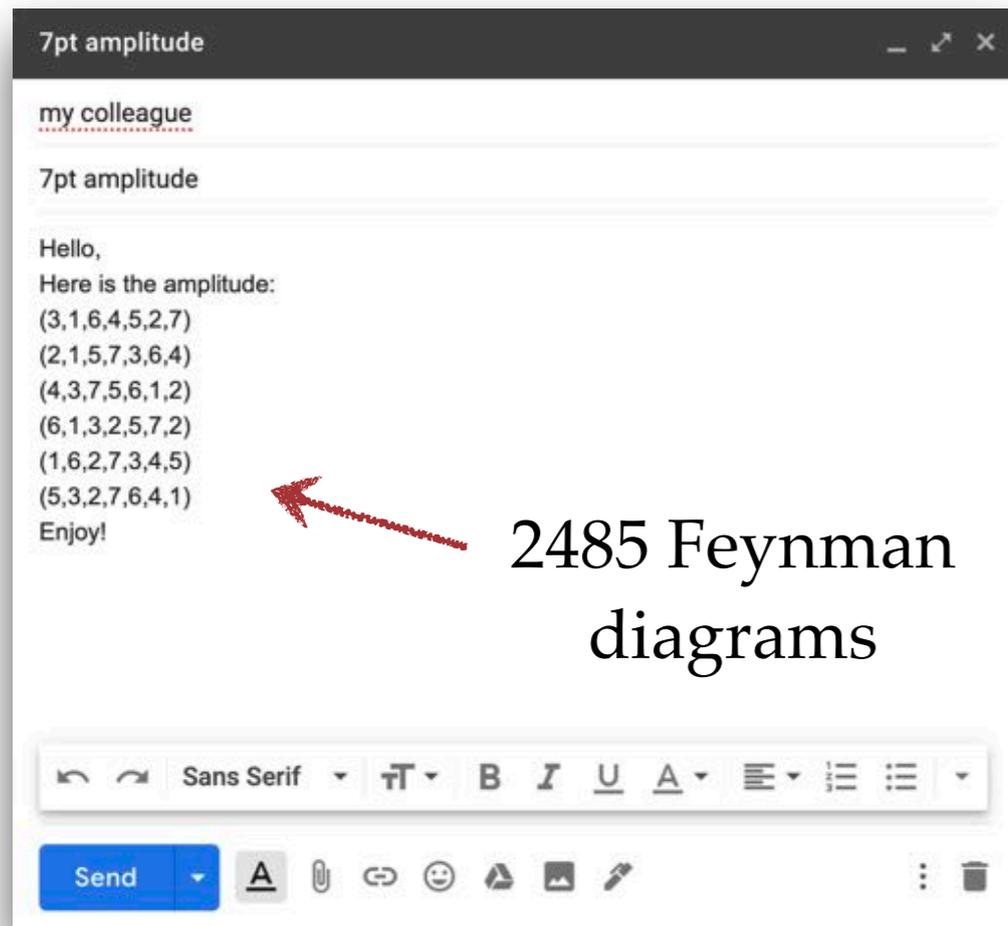

Shift-enter in Mathematica gives the formula

On-shell diagrams and Positive Grassmannian

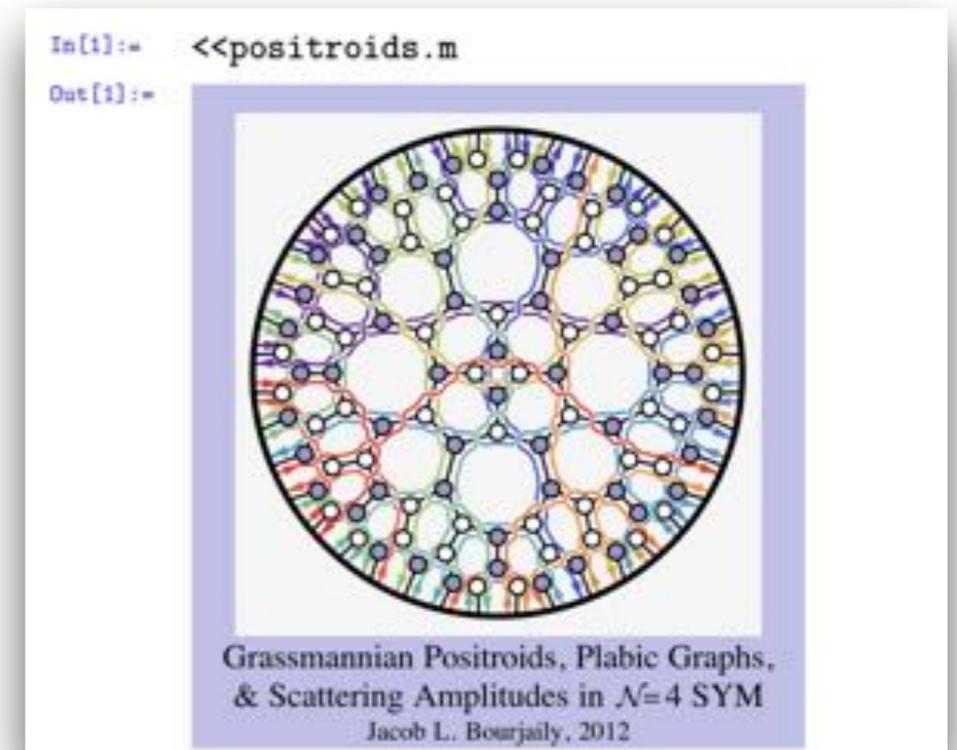

Very efficient way to calculate (tree-level) amplitudes

2485 Feynman diagrams

Shift-enter in Mathematica gives the formula

What is the scattering amplitude as a single object?

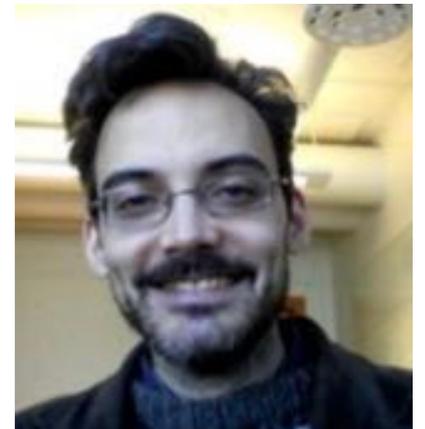

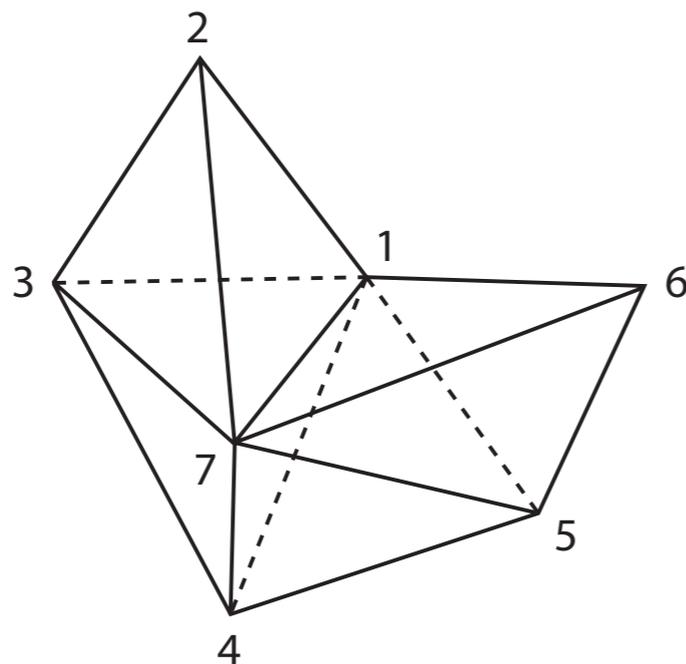

The Amplituhedron

Arkani-Hamed, Trnka (2013), Arkani-Hamed, Thomas, Trnka (2017)

Hodges' observation was not accidental

Special cases the amplitudes correspond to polyhedra, but the general space is the **Amplituhedron**

Seven-gluon scattering at tree-level

The Amplituhedron

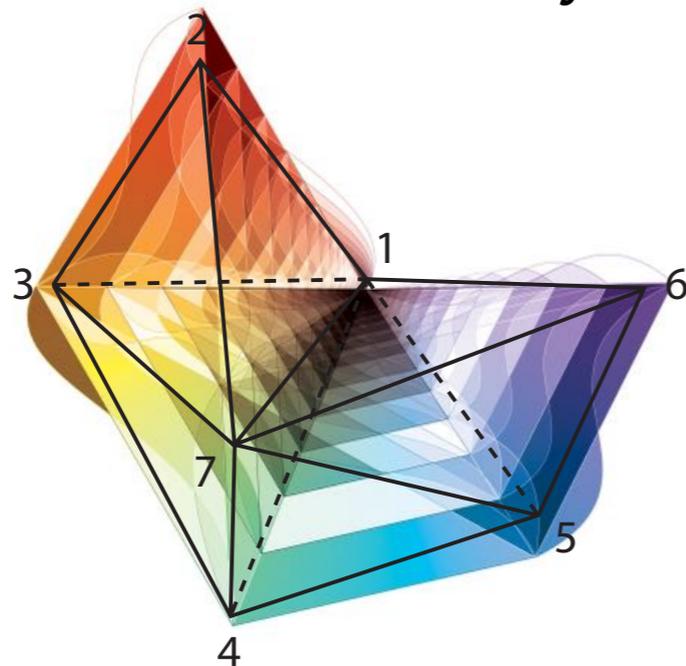

Arkani-Hamed, Trnka (2013), Arkani-Hamed, Thomas, Trnka (2017)

Hodges' observation was not accidental

Special cases the amplitudes correspond to polyhedra, but the
general space is the **Amplituhedron**

Higher-point amplitudes, loops

Multi-dimensional "curvy" spaces

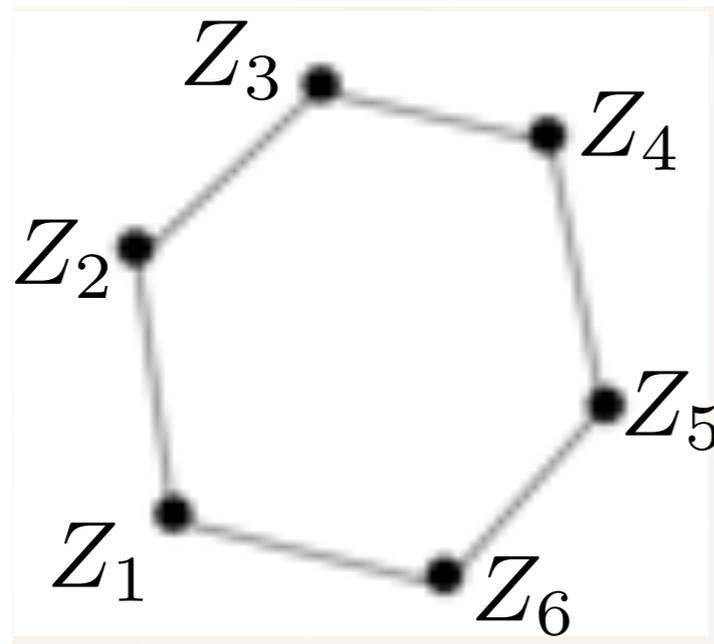

**Gluon amplitudes are volumes
of the Amplituhedron**

The Amplituhedron

Arkani-Hamed, Trnka (2013), Arkani-Hamed, Thomas, Trnka (2017)

Toy example: polygon in the plane - points Z kinematical data

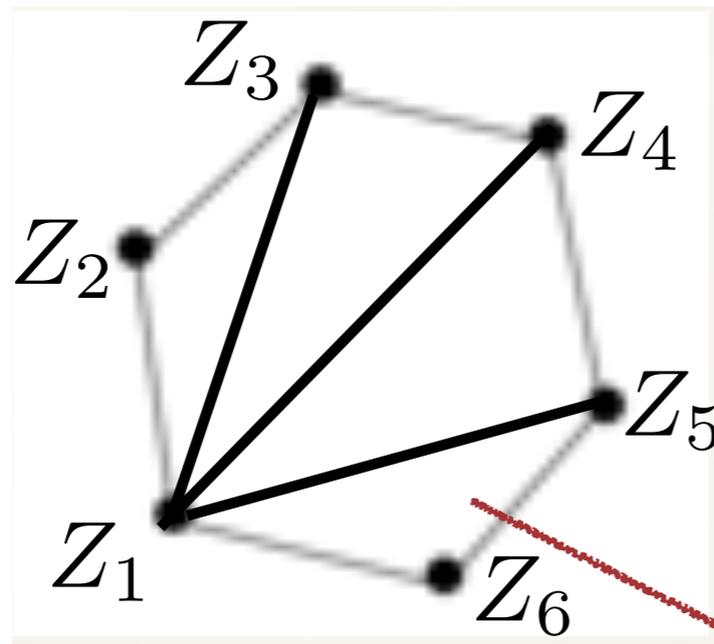

The polygon is a proxy for
the Amplituhedron

The Amplituhedron

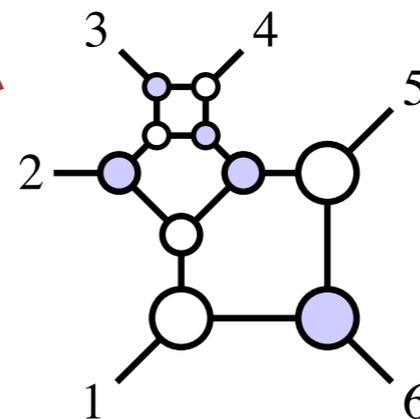

Arkani-Hamed, Trnka (2013), Arkani-Hamed, Thomas, Trnka (2017)

Toy example: polygon in the plane - points Z kinematical data

The polygon is a proxy for
the Amplituhedron

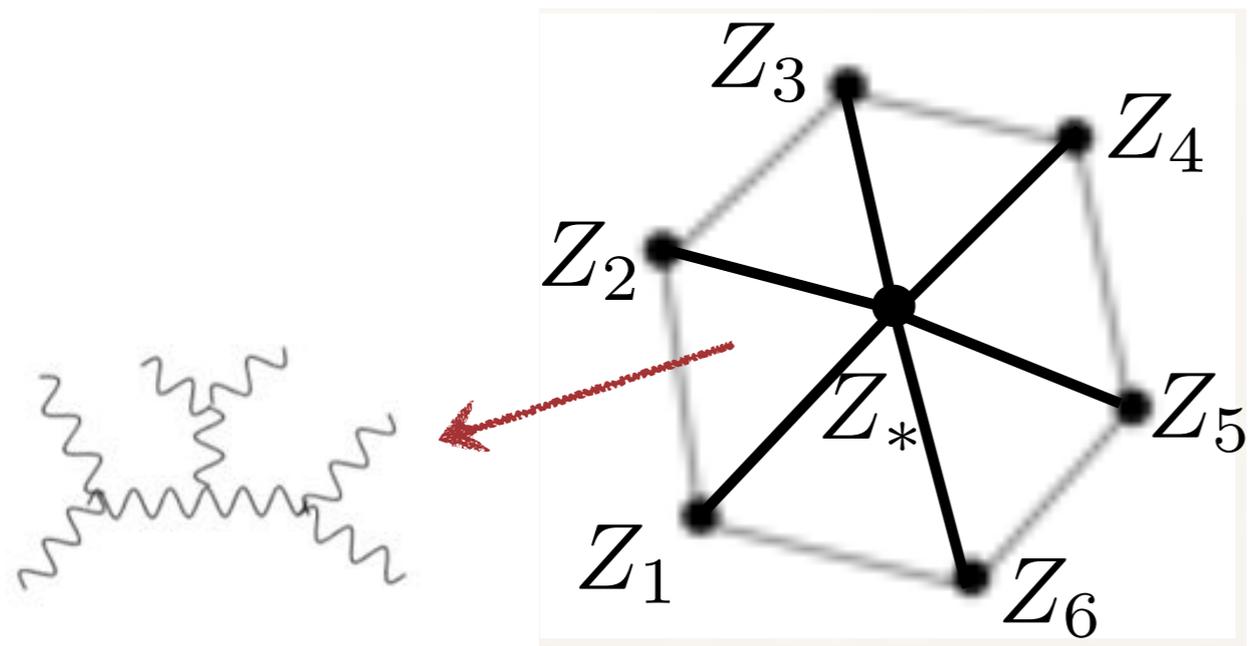

Certain triangulations
correspond to the **on-shell
diagram representation**

The Amplituhedron

Arkani-Hamed, Trnka (2013), Arkani-Hamed, Thomas, Trnka (2017)

Toy example: polygon in the plane - points Z kinematical data

The polygon is a proxy for
the Amplituhedron

Other triangulations
correspond to
Feynman diagrams

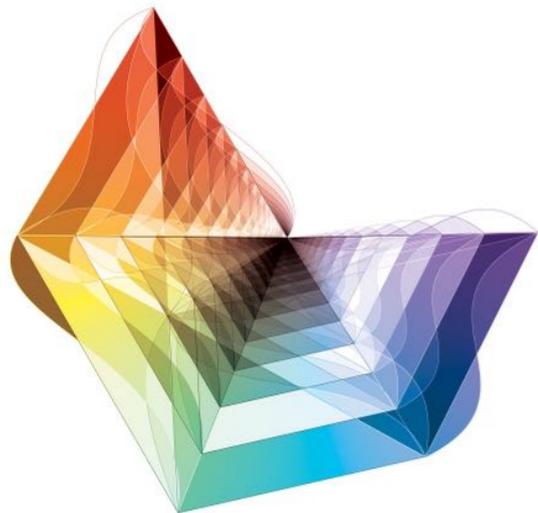

The reference point Z_* is related to the gauge choice

Invariant definition of the “amplitude”:
area of the polygon

The Amplituhedron

Arkani-Hamed, Trnka (2013), Arkani-Hamed, Thomas, Trnka (2017)

Full definition of the Amplituhedron:

geometric region
specified by a set of
inequalities
geometry labeled by n, k, ℓ

differential volume form on this space:
tree-level amplitudes and loop integrands
in planar maximally supersymmetric Yang-Mills theory

n number of particles ℓ number of loops k helicity number

Full definition of Amplituhedron

$y = c \cdot Z$

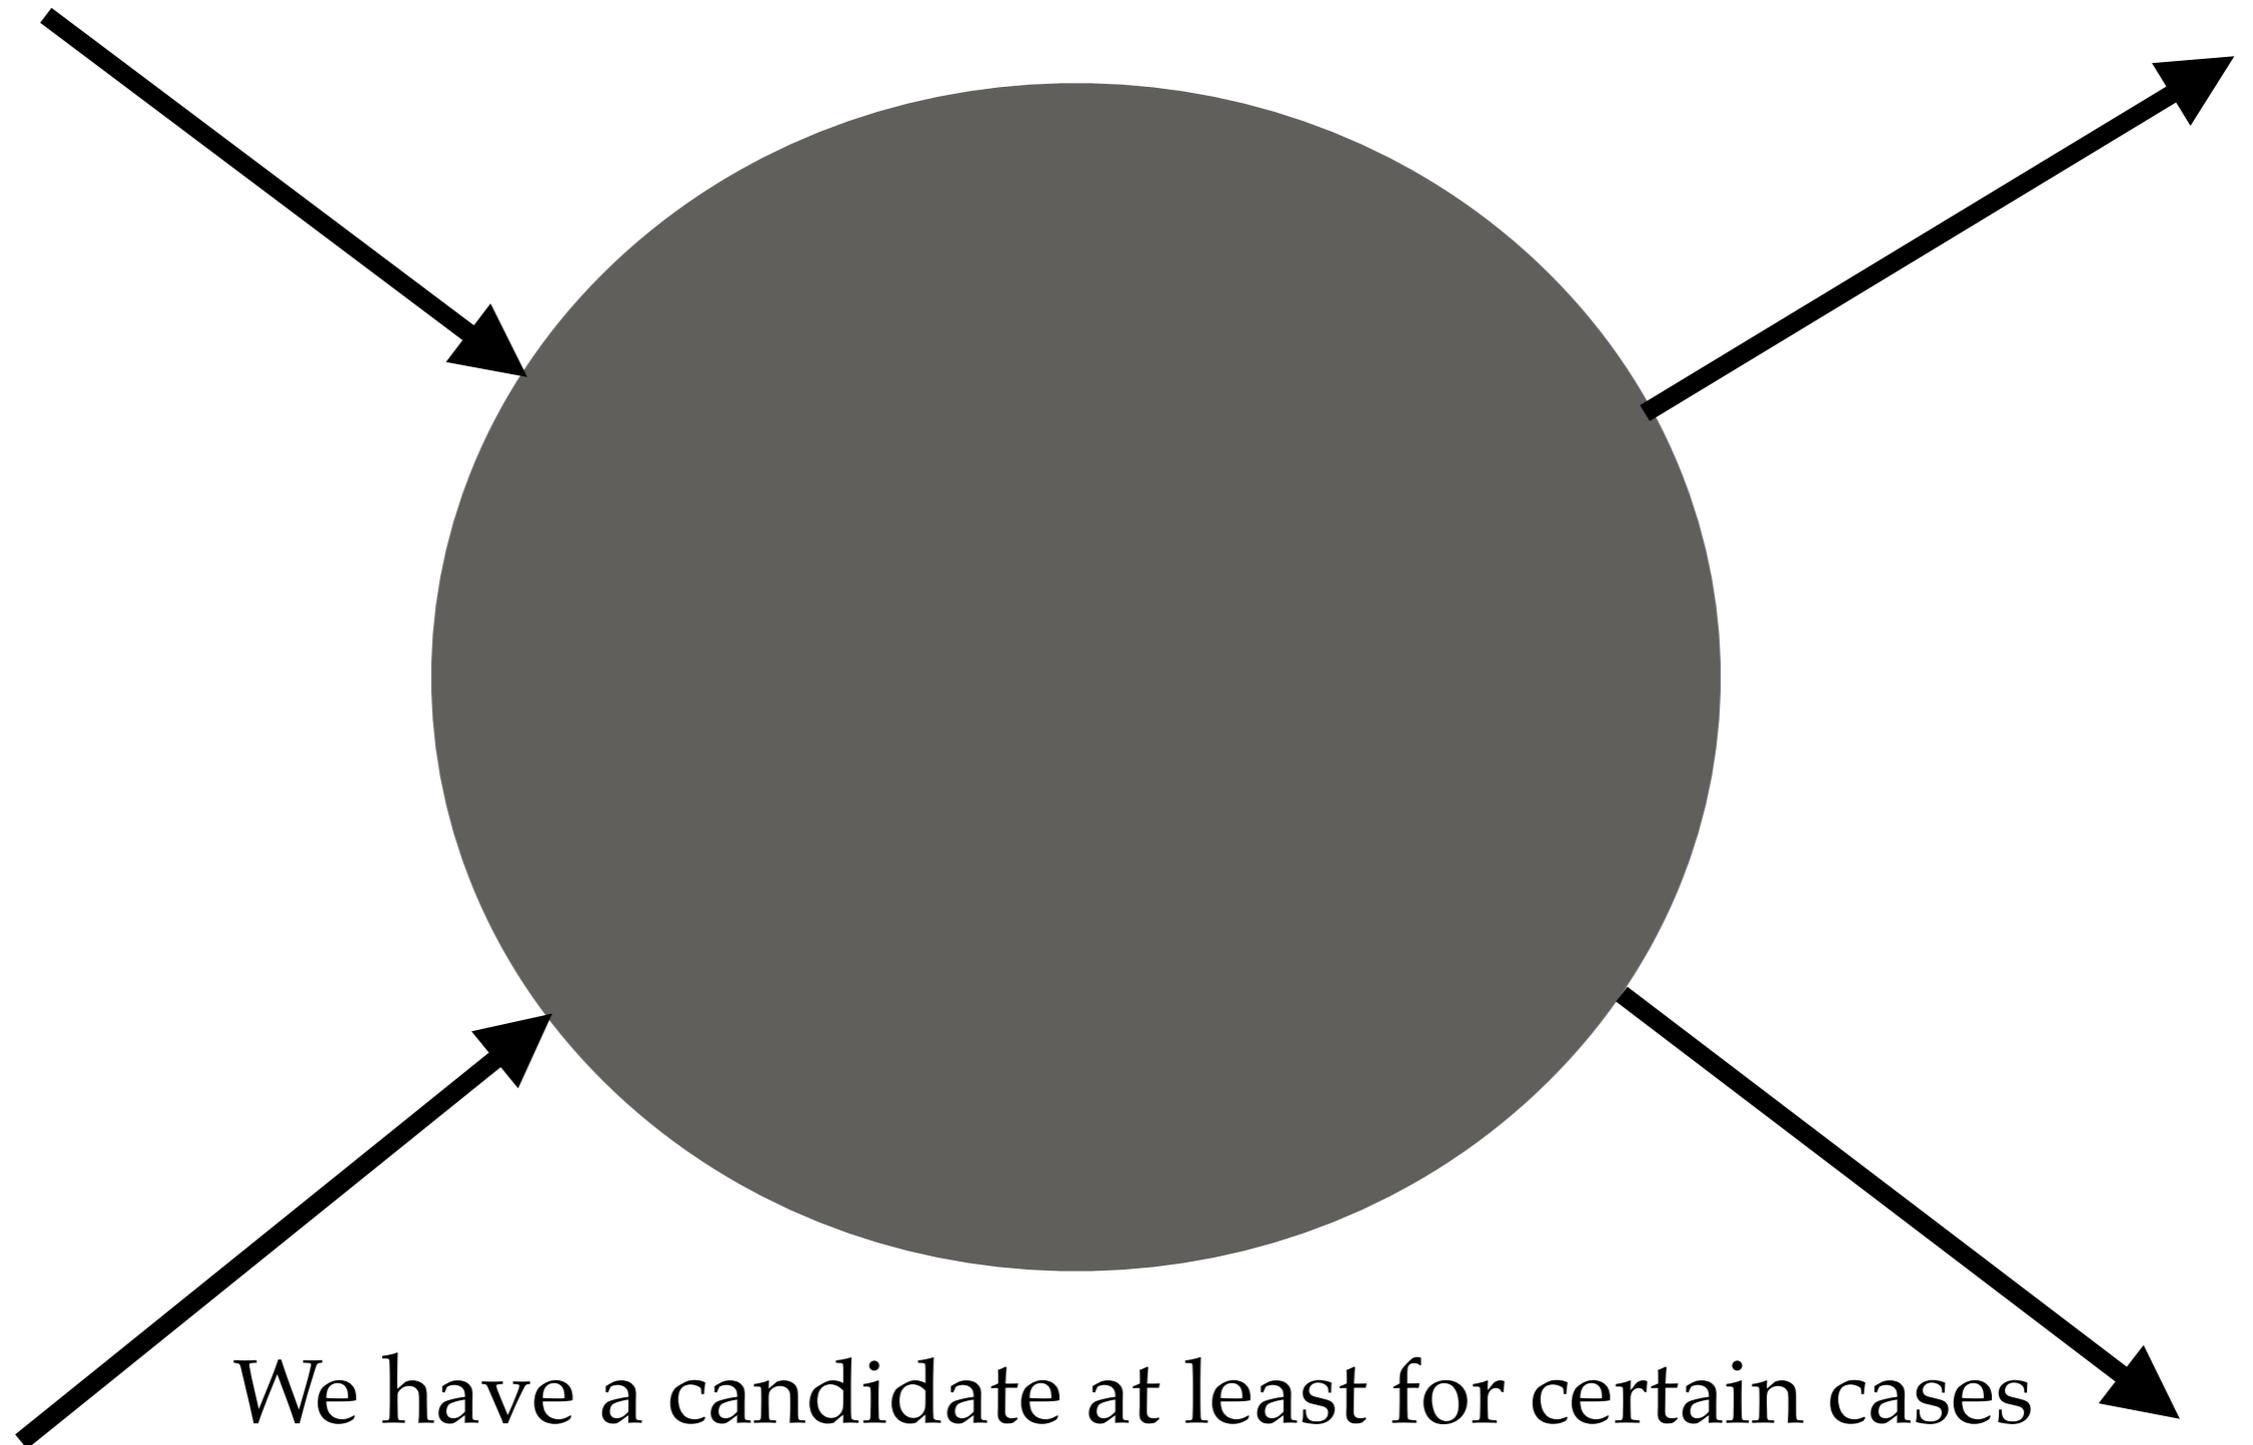

♦ Definitions of objects: ♦ Positivity conditions:

$y = \begin{pmatrix} \frac{Y}{A^{(1)}} \\ \frac{Y}{A^{(2)}} \\ \vdots \\ \frac{Y}{A^{(\ell)}} \end{pmatrix}$	$c = \begin{pmatrix} \frac{C}{D^{(1)}} \\ \frac{C}{D^{(2)}} \\ \vdots \\ \frac{C}{D^{(\ell)}} \end{pmatrix}$	$Z = \begin{pmatrix} z \\ \eta \cdot \phi_1 \\ \vdots \\ \eta \cdot \phi_k \end{pmatrix}$	$\begin{pmatrix} C \\ D^{(1)} \\ \vdots \\ D^{(\ell)} \end{pmatrix} \begin{matrix} Z \in M_+(k+4, n) \\ C \in G_+(k, n) \\ \in G_+(k+2m, n) \\ D^{(i)} = G(2, n) \end{matrix}$
--	--	---	--

♦ $\Omega_{n,k,\ell}$: form with logarithmic singularities on boundaries of \mathcal{Y}
 ♦ The amplitude is: $\mathcal{M}_{n,k,\ell} = \int d^4\phi_1 d^4\phi_2 \dots d^4\phi_k \Omega_{n,k,\ell} \Big|_{Y=(1,0,\dots,0)}$

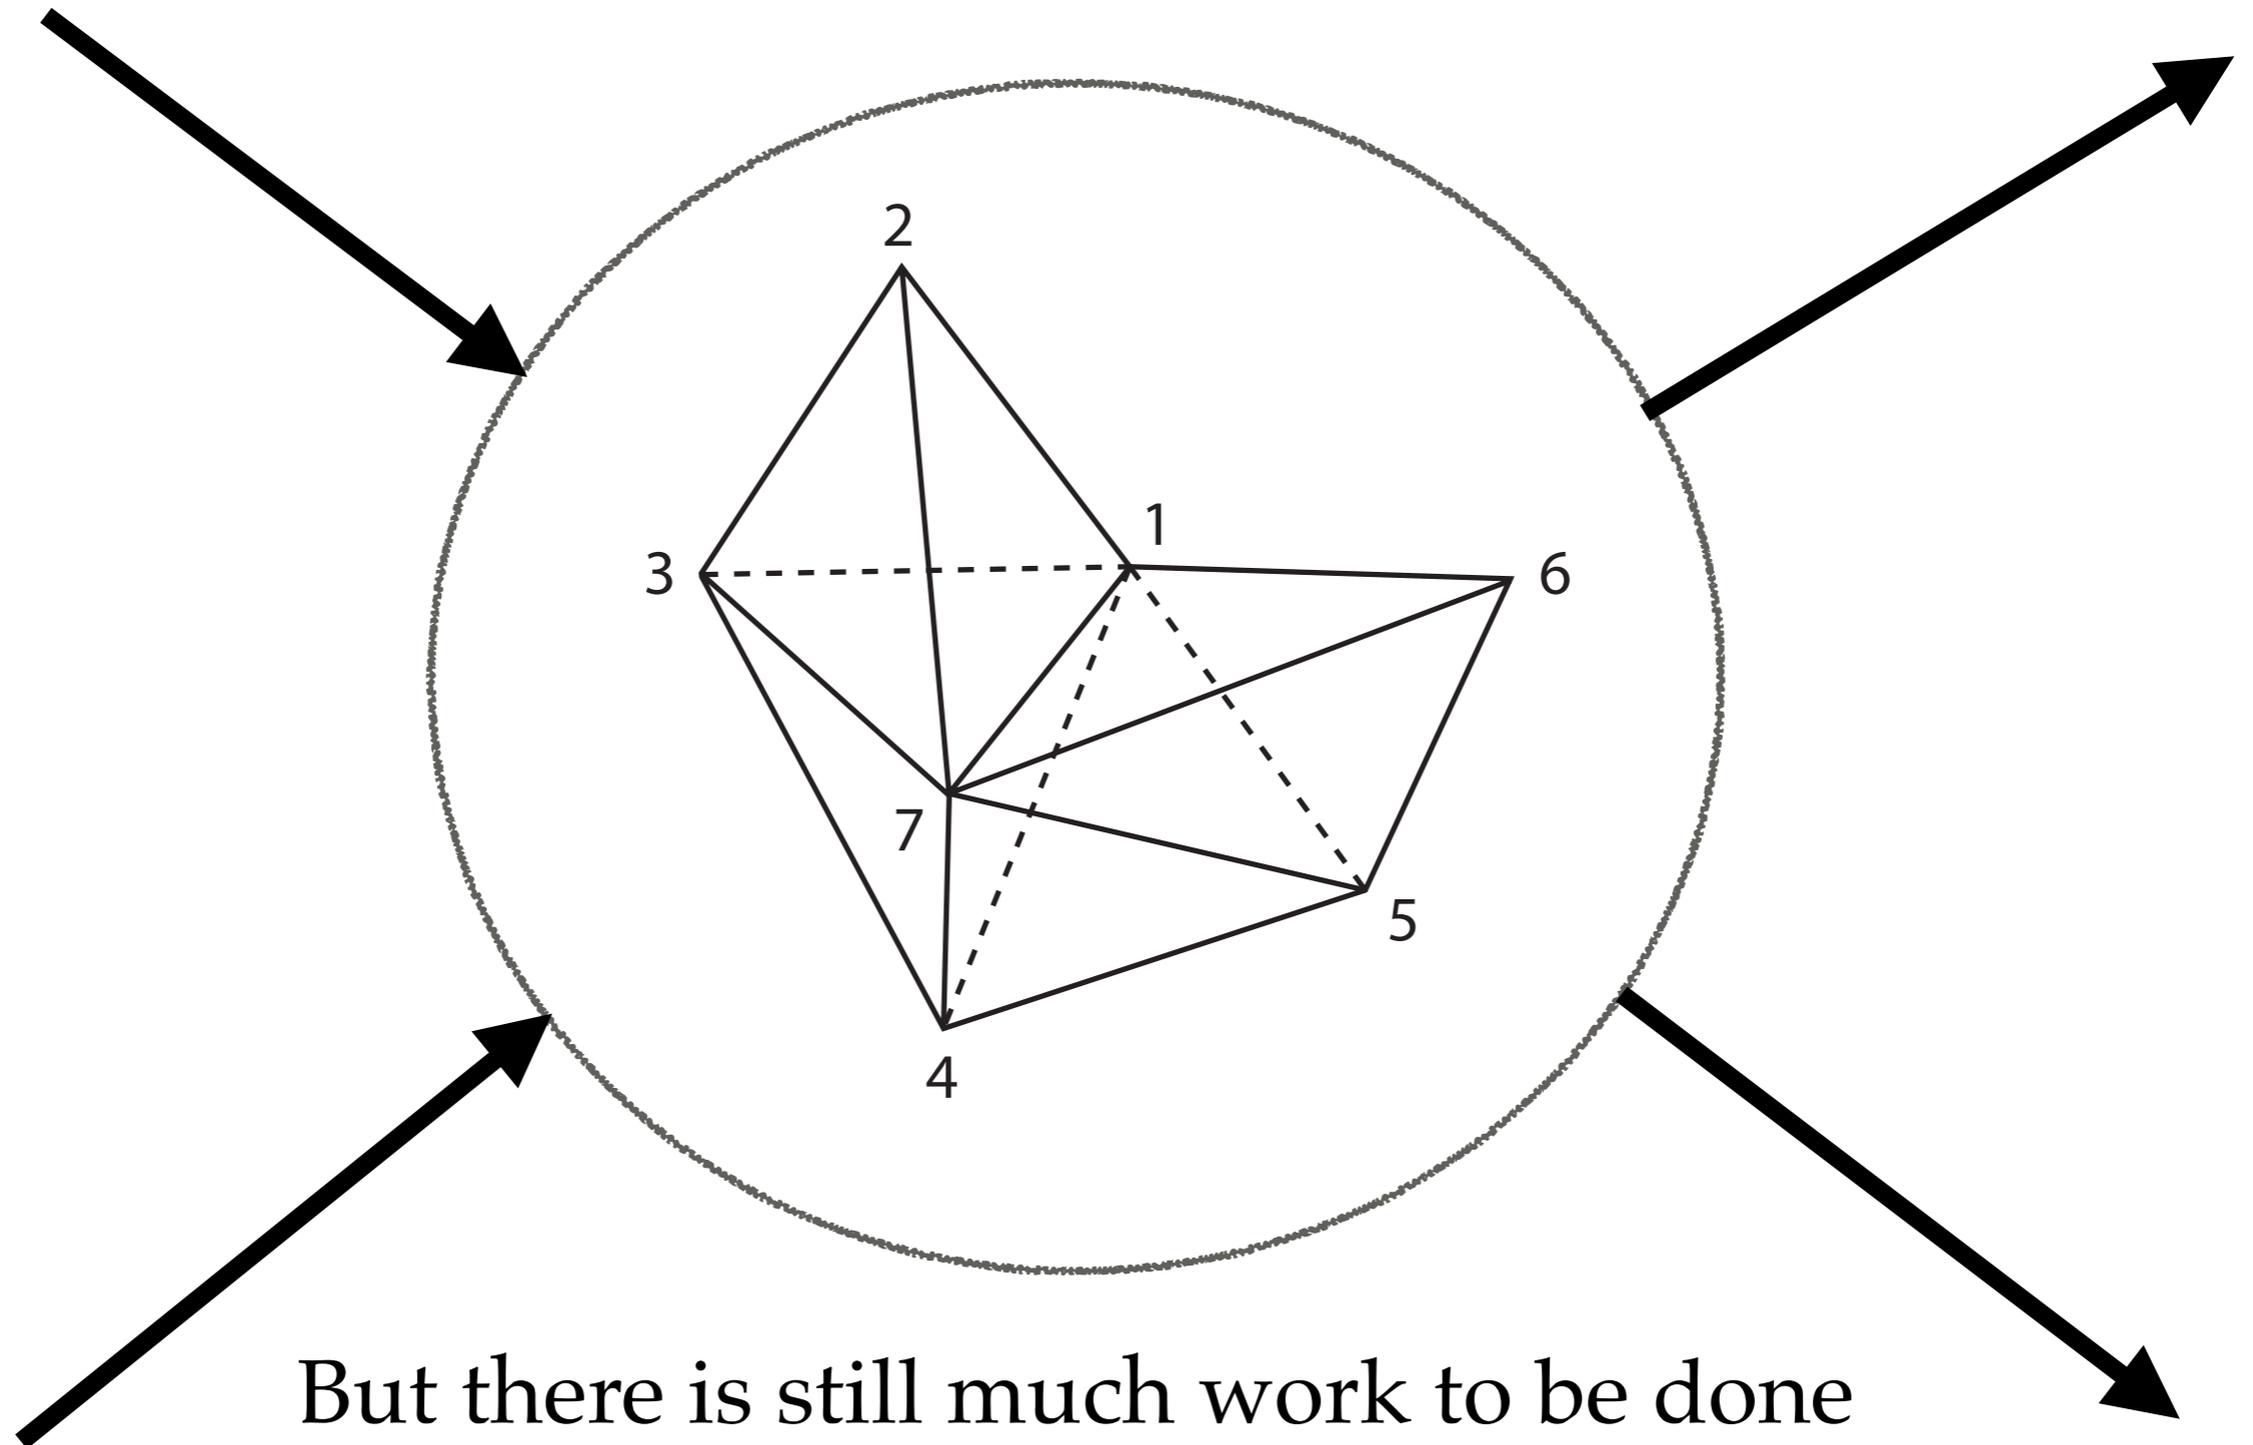

tree-level = QCD
loops = simpler

What is scattering amplitude?

We have a candidate at least for certain cases

What is scattering amplitude?

But there is still much work to be done

Amplitudes in effective field theories

with Kampf, Novotny, Cheung, Shen, Shifman, Bartsch and others

Amplitudes in EFT

- ❖ Tree-level amplitudes of massless particles in EFTs
- ❖ Not considered: bad powercounting, problems with loops, on the opposite side to the spectrum of interesting theories than N=4 SYM theory

❖ Standard procedure: Lagrangian

Symmetry

Properties of amplitudes

Amplitudes in EFT

- ❖ Here we consider a completely different perspective
 - Start with generic Lagrangian with free couplings
= free parameters in the amplitude
 - Impose kinematical constraints on scattering
amplitudes: fix all parameters - find unique theory
- ❖ Classify interesting EFTs, perhaps find some new ones
- ❖ It is easier to impose kinematical constraints on amplitudes than to search in space of all symmetries

On-shell amplitudes

- ❖ Massless scalars in D-dimensions
- ❖ On-shell amplitudes $p^2 = 0$
- ❖ Tree-level, no renormalization
- ❖ Low energies: derivative expansion

Three point interactions

- ❖ Consider a single scalar field theory given by

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + \mathcal{L}_{int}(\phi, \partial\phi, \dots)$$

- ❖ Simplest interaction is 3pt but there are no 3pt amplitudes except for $\mathcal{L}_{int} = \lambda\phi^3$

- ❖ Any derivatively coupled term can be written as

$$\mathcal{L}_{int} = (\square\phi)(\dots) \quad \text{and removed by EOM}$$

Fundamental interaction

- ❖ Let us start with a 4pt interaction term

$$\mathcal{L}_{int} = \lambda_4 (\partial^m \phi^4) \longrightarrow \text{many terms}$$

- ❖ Four point amplitude: special kinematics

- ❖ Six point amplitude: presence of contact terms

Powercounting

$$\frac{\partial^m \partial^m}{\partial^2} = \partial^{2m-2} \longrightarrow \begin{array}{c} \diagup \quad \diagdown \\ \text{---} \quad \text{---} \\ \diagdown \quad \diagup \end{array} \quad \begin{array}{c} \diagdown \quad \diagup \\ \text{---} \quad \text{---} \\ \diagup \quad \diagdown \end{array} \quad \mathcal{L}_6 = \partial^{2m-2} \phi^6$$

- ❖ For $\mathcal{L}_{int} = \lambda_4 \phi^4$ no contact terms possible

Infinite tower

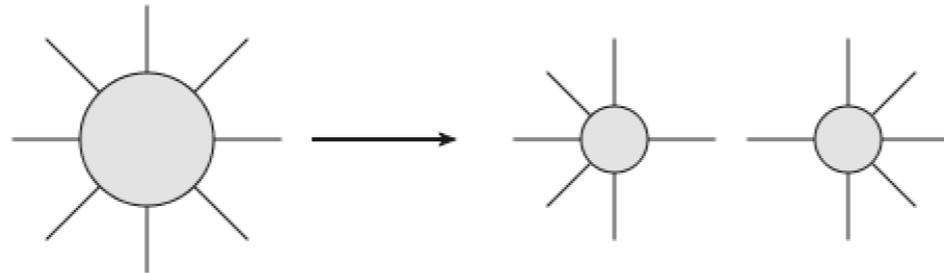

- ❖ We consider the infinite tower of terms

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + \lambda_4(\partial^m\phi^4) + \lambda_6(\partial^{2m-4}\phi^6) + \dots$$

- ❖ Even if we start with the 4pt term we can do field redefinitions and generate infinite tower
- ❖ We get a generic amplitude $A_n(\lambda_4, \lambda_6, \dots)$
- ❖ Find constraints which uniquely specifies all couplings

On-shell constructibility

- ❖ On the pole the amplitude must factorize

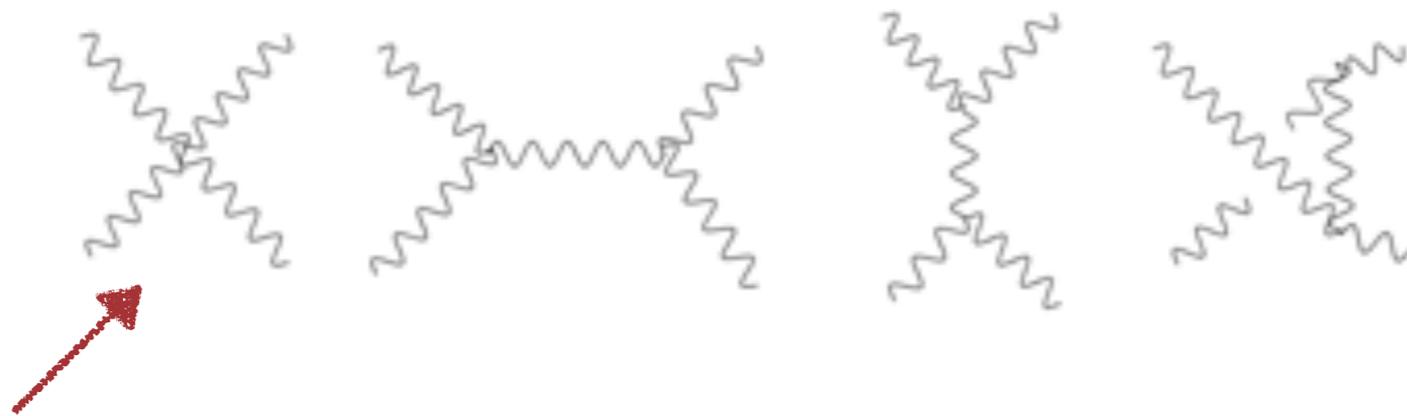

- ❖ Contact terms vanish on all poles: not detectable
- ❖ Therefore, EFT amplitudes are not specified only by factorization - unfixed kinematical terms

$$\frac{s_{12}s_{56}}{s_{123}} \sim \frac{(s_{12} + s_{123})s_{56}}{s_{123}} \quad \text{on the pole}$$

On-shell constructibility

- ❖ Naively, this problem arises also in YM theory
- ❖ In fact, the contact terms there is completely fixed

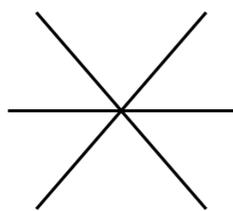

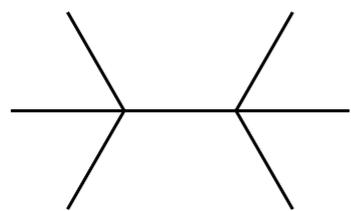

Contact term

Imposing gauge invariance fixes it

- ❖ In our case, contact terms are unfixed with free parameters, there is no gauge invariance

Extra constraints

- ❖ If we want to fix the amplitude completely we have to impose additional constraints!
- ❖ It must link the contact terms to factorization terms

None of them
individually
satisfy condition X

- ❖ Natural condition for EFTs at low energies

Soft limit $p \rightarrow 0$

Single scalar

- ❖ The first non-trivial is the original example

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + c_4(\partial\phi)^4 + c_6(\partial\phi)^6 + c_8(\partial\phi)^8 + \dots$$

- ❖ Calculate 6pt amplitude

$$(\partial\phi)^{2n} = [(\partial_\mu\phi)(\partial^\mu\phi)]^n$$

$$s_{ij} = (p_i + p_j)^2$$

$$A_6 = \sum_{\sigma} \left[\begin{array}{c} 3 \quad 4 \\ \diagdown \quad / \\ 2 \text{---} \text{---} 5 \\ / \quad \diagdown \\ 1 \quad 6 \end{array} \right] + \left[\begin{array}{c} 3 \quad 4 \\ \diagdown \quad / \\ 2 \text{---} \text{---} 5 \\ / \quad \diagdown \\ 1 \quad 6 \end{array} \right]$$

$$= 4 \sum_{\sigma} c_4^2 \frac{(s_{12}s_{23} + s_{23}s_{13} + s_{12}s_{13})(s_{45}s_{56} + s_{45}s_{46} + s_{46}s_{56})}{s_{123}} + c_6 s_{12}s_{34}s_{56}$$

trivial soft-limit vanishing $p_i \rightarrow 0 \iff$ Lagrangian trivially invariant
 $\phi \rightarrow \phi + a$

Single scalar

- ❖ The first non-trivial is the original example

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + c_4(\partial\phi)^4 + c_6(\partial\phi)^6 + c_8(\partial\phi)^8 + \dots$$

- ❖ Calculate 6pt amplitude

$$(\partial\phi)^{2n} = [(\partial_\mu\phi)(\partial^\mu\phi)]^n$$

$$s_{ij} = (p_i + p_j)^2$$

$$A_6 = \sum_{\sigma} \left[\begin{array}{c} 3 \\ \diagup \\ 2 \text{---} \text{---} 5 \\ \diagdown \\ 1 \end{array} \begin{array}{c} 4 \\ \diagdown \\ \text{---} \text{---} \\ \diagup \\ 6 \end{array} \right] \left[\begin{array}{c} 3 \\ \diagdown \\ 2 \text{---} \text{---} 5 \\ \diagup \\ 1 \end{array} \begin{array}{c} 4 \\ \diagup \\ \text{---} \text{---} \\ \diagdown \\ 6 \end{array} \right]$$

$$= 4 \sum_{\sigma} c_4^2 \frac{(s_{12}s_{23} + s_{23}s_{13} + s_{12}s_{13})(s_{45}s_{56} + s_{45}s_{46} + s_{46}s_{56})}{s_{123}} + c_6 s_{12}s_{34}s_{56}$$

Impose quadratic
vanishing

$$A_6 \rightarrow \mathcal{O}(t^2)$$

$$\begin{aligned} p_i &\rightarrow tp_i \\ t &\rightarrow 0 \end{aligned}$$

Single scalar

- ❖ The first non-trivial is the original example

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + c_4(\partial\phi)^4 + c_6(\partial\phi)^6 + c_8(\partial\phi)^8 + \dots$$

- ❖ Calculate 6pt amplitude

$$(\partial\phi)^{2n} = [(\partial_\mu\phi)(\partial^\mu\phi)]^n$$

$$s_{ij} = (p_i + p_j)^2$$

$$A_6 = \sum_{\sigma} \left[\begin{array}{c} 3 \\ \diagup \\ 2 \text{---} \text{---} 5 \\ \diagdown \\ 1 \end{array} \begin{array}{c} 4 \\ \diagdown \\ \text{---} \text{---} \\ \diagup \\ 6 \end{array} \right] + \left[\begin{array}{c} 3 \\ \diagdown \\ 2 \text{---} \text{---} 5 \\ \diagup \\ 1 \end{array} \begin{array}{c} 4 \\ \diagup \\ \text{---} \text{---} \\ \diagdown \\ 6 \end{array} \right]$$

$$= 4 \sum_{\sigma} c_4^2 \frac{(s_{12}s_{23} + s_{23}s_{13} + s_{12}s_{13})(s_{45}s_{56} + s_{45}s_{46} + s_{46}s_{56})}{s_{123}} + c_6 s_{12}s_{34}s_{56}$$

There is a single solution and it fixes: $c_6 = 4c_4^2$

Single scalar

- ❖ The first non-trivial is the original example

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + c_4(\partial\phi)^4 + c_6(\partial\phi)^6 + c_8(\partial\phi)^8 + \dots$$

- ❖ Apply to higher point amplitudes $(\partial\phi)^{2n} = [(\partial_\mu\phi)(\partial^\mu\phi)]^n$
 $s_{ij} = (p_i + p_j)^2$

$$A_n = \mathcal{O}(t^2) \quad \text{for} \quad \begin{array}{l} p_i \rightarrow tp_i \\ t \rightarrow 0 \end{array}$$

- ❖ Cancellations between diagrams required, a unique solution exists and relates $c_{2n} \sim c_4^\#$

Single scalar

- ❖ The Lagrangian becomes

$$\mathcal{L} = -\frac{1}{g} \sqrt{1 - g(\partial\phi)^2} \quad \text{where } g = 8c_4$$

- ❖ Apply to higher point amplitudes

$$A_n = \mathcal{O}(t^2) \quad \text{for } \begin{array}{l} p_i \rightarrow tp_i \\ t \rightarrow 0 \end{array}$$

- ❖ Cancellations between diagrams required, a unique solution exists and relates $c_{2n} \sim c_4^\#$

Result: DBI action

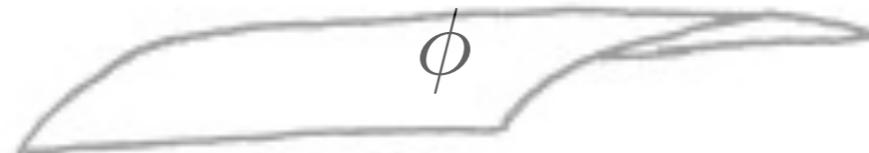

(Dirac, Born, Infeld 1934)

- ❖ The Lagrangian becomes

$$\mathcal{L} = -\frac{1}{g} \sqrt{1 - g(\partial\phi)^2} \quad \text{where } g = 8c_4$$

- ❖ It describes the fluctuation of D-dimensional brane in (D+1) dimensions

- ❖ What is the symmetry principle behind this?

Result: DBI action

(Dirac, Born, Infeld 1934)

- ❖ Symmetry of the action: (D+1) Lorentz symmetry

$$\phi \rightarrow \phi + (b \cdot x) + (b \cdot \phi \partial \phi)$$

- ❖ It can be shown that this implies the soft limit behavior

- ❖ But we can also derive the action based on the soft limit

$$2\mathcal{L}'(X)/g = 2X\mathcal{L}'(X) - \mathcal{L}(X) \quad \rightarrow \quad \mathcal{L}(X) \sim \sqrt{1 - gX}$$

$$\text{where } X = (\partial\phi)^2$$

Next case

- ❖ Let us consider the next Lagrangian

$$\mathcal{L}_2 = \frac{1}{2}(\partial\phi)^2 + \lambda_4(\partial^6\phi^4) + \lambda_6(\partial^{10}\phi^6) + \dots$$

- ❖ Calculate amplitudes: impose again $A_n = \mathcal{O}(t^2)$

Galileon

- ❖ Let us consider the next Lagrangian

$$\mathcal{L}_2 = \frac{1}{2}(\partial\phi)^2 + \lambda_4(\partial^6\phi^4) + \lambda_6(\partial^{10}\phi^6) + \dots$$

- ❖ Calculate amplitudes: impose again $A_n = \mathcal{O}(t^2)$

Fully specifies a family of solutions

Galileons

Galilean symmetry $\phi \rightarrow \phi + a + (b \cdot x)$

Relevant for
cosmological models

- ❖ There are (d-2) Lagrangians:

$$\mathcal{L}_n = \phi \det[\partial^{\mu_j} \partial_{\nu_k} \phi]_{j,k=1}^n \quad n \leq d$$

Special Galileon

- ❖ Not enough for us: not minimal, not unique
- ❖ We impose even stronger condition

$$A_n = \mathcal{O}(t^3) \quad \text{for} \quad \begin{array}{l} p_i \rightarrow tp_i \\ t \rightarrow 0 \end{array}$$

- ❖ And there exists an unique solution, linear combination of Galileon Lagrangians: we called it **special Galileon**

Effective Field Theories from Soft Limits

Clifford Cheung, Karol Kampf, Jiri Novotny, Jaroslav Trnka

(Submitted on 12 Dec 2014)

A Hidden Symmetry of the Galileon

Kurt Hinterbichler, Austin Joyce

(Submitted on 29 Jan 2015)

$$\phi \rightarrow s_{\mu\nu} x^\mu x^\nu + \frac{\lambda_4}{12} s^{\mu\nu} (\partial_\mu \phi)(\partial_\nu \phi)$$

Classification

- ❖ Use soft-limit as classification tool

(Cheung, Kampf, Novotny, Shen, JT 2016)

(Elvang, Hadjantonis, Jones, Paranjape 2018)

- ❖ Extension to vector fields: Born-Infeld theory

(Cheung, Kampf, Novotny, Shen, JT 2018)

$$\mathcal{L} = \sqrt{(-1)^{D-1} \det(\eta_{\mu\nu} + F_{\mu\nu})}$$

- ❖ Non-trivial soft theorems

(Kampf, Novotny, Shifman, JT 2019)

- ❖ Close connection to color-kinematics duality, worldsheet integrals (scattering equations)

(Bern, Carrasco, Johansson 2009)

(Cachazo, He, Yuan 2014)

Conclusion

Summary

- ❖ Amplitudes: probe to learn new things about QFTs
- ❖ Many different research directions, I mentioned some of them, but different people care about different things
- ❖ Amplituhedron & positive geometry: completely new approach (physics \rightarrow math), only special theories now
- ❖ Recent connections to cosmology: EFTs for inflation, calculation of cosmological correlators (related to S-matrix)
